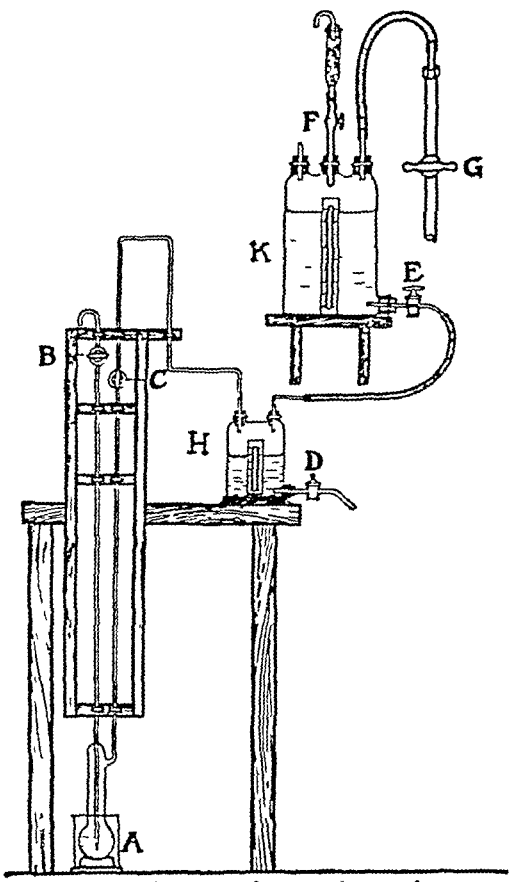
The term "rachi-resistance" has no exact counterpart in the English language It is used to describe a condition in which an intrathecal injection of an average or a greater than average dose of spinal anaesthetic fluid produces little or no effect The great majority of failures to produce adequate spinal anaesthesia are due to errors of technique, of which the commonest are inaccurate punctures and faulty postural arrangement of the patient Failure may also be due to the use of inactive solutions, or very rarely to some pathological lesion such as a cord tumour (Thompson 1934) However, we are not concerned with these cases here but only with those where there is no doubt that the anaesthetic has reached the nerve roots without the subsequent production of anaesthesia

Case Records

In a series of 657 cases of spinal anaesthesia, 300 of which have been recorded elsewhere (Walters 1932), we have encountered two cases of "rachi-resistance," particulars of which are given below



Case 1.—A woman aged 33 underwent hysterectomy for multiple uterine fibroids on June 27, 1935 In the left lateral position a smooth puncture was made between the third and fourth lumbar vertebrae and 1.5 c.cm. of decicaine was injected The patient was then placed in the ventral decubitus No anaesthesia resulted Ten minutes later another 1 c.cm. was given without effect Lastly a further 1.5 c.cm. was administered, this time between the second and third lumbar vertebrae Beyond a slight loss of tactile sensation in the perineum no anaesthesia was produced, and the operation was proceeded with under a general anaesthetic

N.B.—Decicaine is a powerful anaesthetic solution In a short series of 104 cases we have had no other failures, and have not exceeded a dose of 2.5 c.cm. even for such major procedures as abdomino-perineal excision of rectum Decicaine is manufactured by Bayer Products Ltd. and until recently was known as pantocaine, with which preparation it is identical Chemically it is *p*-butyl-amino-benzoyl-dimethyl-amino-ethanol hydrochloride its viscosity is 1.8–2, and its specific gravity 1.0009 On an average a dose of 2.5 c.cm. of this drug will give slightly over two hours anaesthesia

Case 2.—A man aged 44 was admitted to hospital with thrombo-angiitis obliterans (Buerger) As part of the investigation spinal anaesthesia was used On July 26, 1935, a smooth puncture was made between the third and fourth lumbar vertebrae, 1.5 c.cm. dicaine was injected No anaesthesia resulted Our interest now aroused we gave 2.5 c.cm. of decicaine on July 29, no anaesthesia ensued We were by this time convinced that we were dealing with a case of 'rachi-resistance' but in order to exclude all errors so far as possible we decided to try again with yet another drug On August 1 18 c.cm. of percaine solution, 1 in 1,500, was given employing the Howard Jones technique (1930) (This is a large dose Franken (1935) states Experience has proved that the dose of 18 c.cm. exceeds the limit of safety.) After ten minutes the patient complained of some tingling and numbness in both legs After fourteen minutes there was no loss of sensation but the legs felt heavy After thirty minutes there was a slight loss of epicritic sensation in the perineum There was no loss of sensibility to pain in any region, whilst thermal sensibility, tactile sensation and

100 000 M U From a search in the literature on the subject it appears by far the highest concentration which has as yet been used was in the treatment of six cases at the Radium Institute London, in one of these the daily dose was as high as 1 5 millicuries

Some experimental work has been done on animals Jansen and Schultzer (1926) using the continuous inhalation method in high concentration found that rats lost weight and died The coagulation time of the blood was increased and there was a marked leucopenia At the post mortem examinations haemorrhages were found in the lungs the spleen was enlarged, and there was glandular atrophy

Apparatus for the supply of radon solutions of varying concentration

The basis of the claim made for the administration of radon in general therapeutics is that small quantities have a stimulating effect upon cell activity In addition to this general cell stimulation it is further claimed that radon has a selective action promoting the growth of healthy cells, whilst being inimical to morbid ones, that it stimulates the production of erythrocytes lowers the blood pressure, produces diuresis and increases the excretion of uric acid ' *(Saubermann)*

From published clinical reports it appears that the most favourable results have been obtained in various forms of rheumatism, although improvement has also been reported in hyperpiesia in endocrine disturbances and over a wide field of pathological conditions Successful clinical results are undoubtedly obtained at many well-known spas, but no statistical evidence has been adduced to show that treatment at those spas in which the radium content is relatively high is accompanied by any enhanced therapeutic effect

The Present Investigation

Preparation of the Radon Water—A simple apparatus was required to provide aqueous solutions of radon having a wide range of strength the mean being about one millicurie in 10 oz of water The apparatus to be described has been found to satisfy these requirements

DESCRIPTION OF APPARATUS

The source of radon is an aqueous solution of radium bromide It is contained in the small flask A which has a volume of about 50 c cm and which is approximately half full of a solution which contains radium bromide equivalent to about 25 milligrammes of radium element The flask communicates through glass tubing with the Woulfe's bottle D which has a capacity of about 250 c cm and can be shut off by the stopcock C A second tube carrying the stopcock B enables radon to be swept out of the apparatus when the occasion arises by bubbling air through the solution The bulb A rests on a rubber pad contained in a stout glass jar which serves to retain the radium solution in the event of breakage of the bulb The jar is at floor level and the flask with its connecting tubing is supported on a wooden framework fitted through the top of the table upon which the Woulfe's bottle D rests This arrangement permits heavy screening blocks of lead to rest on the floor and surround the whole table for the protection of the personnel Further lead blocks are placed close to the jar containing the radium bulb The supply of water comes from a large Woulfe's bottle K (capacity 12 litres) which is supported on a wall bracket at about a foot above H It acts as a reservoir and is fed from the water main which can be shut off at the tap G The reservoir is open to the air through the stopcock F which is provided with a filter of cotton wool to prevent entry of dust and micro organisms The two Woulfe's bottles are provided with scales in order to be able to repeat any particular water level By varying the level in H it is possible to work with concentrations of radon ranging from 0 02 to 4 millicuries per 10 oz The actual content of radon is found by measurements on a gamma ray electroscope With the smallest concentrations the measurements are made by means of the beta ray electroscope devised and described by B A Spicer

METHOD OF OPERATION

The normal positions of the stopcocks are shown in the diagram but it is well to close C during the initial filling of the bottle H The bottle H is filled to a mark predetermined by experiment for it is the water level in this bottle which determines the concentration of radon that is obtainable Once set the water level in this part of the apparatus remains sensibly constant With the tap E shut the upper reservoir K is filled from the mains to any convenient scale mark selected as a working level With the main tap shut off the taps E and C may now be opened and the whole apparatus is left for the radon to diffuse into the vessel H a proportionate part of it diffusing throughout the water the coefficient of solubility of which is 0 at 14 C When the steady state has been attained the radon solution is drawn off into any suitable vessel (such as a bottle which can be corked) by opening the tap D The water in H is automatically replenished from the upper reservoir the water level in which is maintained by admitting water from the main

The Clinical Tests

The cases selected for our observations were mostly patients suffering from various forms of rheumatism, such as osteo-arthritis chronic rheumatoid arthritis fibrositis and neuritis although other diseases were also included in the series They were separated into the two categories out patients and in patients

the "1 c.cm of thin yellow pus" found at operation (in October, 1934) upon a subacute abscess of the first left costal cartilage. The patient's serum agglutinated *B. paratyphosus* B up to a dilution of 1 in 500. There was an indefinite history of paratyphoid fever fourteen years previously, but blood culture and Widal reactions were then negative.

Van Dyk (1933), in a symposium on enteric fever, recalled a man who had typhoid fever during the siege of Mafeking, passed the next twenty-four years as a soldier and a policeman, was kicked by a horse on the lower part of the right thigh, and straightway developed an osteomyelitis at the site. The pus gave a pure growth of *B. typhosus*.

We are indebted to Emeritus Professor Walker Hall and Dr. D. M. Stone, clinical pathologist in the Preventive Medicine Laboratories, for advice and permission to report this case; to Dr. Peters of Ham Green Isolation Hospital for the progress notes and for pointing out the rarity of such a young patient entering the carrier state; and to Mr. T. J. Shields, B.M.A. librarian, for obtaining the references for us.

Acute Puerperal Inversion

With reference to the clinical memorandum in the *Journal* of October 17, 1936 (p. 760), it might be of interest to quote another case of acute puerperal inversion, the mechanism being the same—that is, traction on the cord.

In the spring of 1932 a Hindu patient was brought to me, having been spontaneously delivered of a living male child 8 lb. in weight. She was about 23 years of age, 4 para. In India an 8 lb. child is large, the average being 6½ lb. The native midwife pulled on the cord and delivered a large placenta by this means. When seen by me the patient was profoundly shocked and bloodless from free haemorrhage. The fundus presented at the vulva, the uterus being completely inverted with the cervix fairly high in the vagina. The uterus was not palpable from the abdomen. In view of the general sepsis of native methods and because relatives tend to remove the patient when they think nothing is being done, it was decided to try and replace the organ forthwith. Accordingly the parts were well douched with iodine after cleansing and under chloroform anaesthesia and by careful and prolonged manual pressure on the fundus in a circumferential manner the uterus was reduced gradually in about fifteen minutes and resumed its normal position. An intra-uterine iodine douche was now given, but no pituitrin was required, and I was of the opinion that any forcible contraction might reproduce the inversion. Saline infusions were given, and the patient made a good immediate recovery. In about ten days pyometra developed, which responded well to daily intra-uterine douching followed by glycerin. The whole endometrium appeared to be shed—over a period of about two weeks. The patient then developed dysentery and afterwards malignant malaria, but eventually, after about three months in hospital, went home completely recovered. In a short time menstrual function reappeared, she became pregnant, and delivered a full-time child a year after leaving hospital.

It is interesting to note that during the septic condition of the uterus there was no appreciable involvement of the parametrial tissues or adnexa.

Dow Memorial Hospital.

Reviews

ENCYCLOPAEDIA OF MEDICINE

The British Encyclopaedia of Medical Practice including Medicine, Surgery, Obstetrics and Gynaecology, and other Special Subjects. Edited by Sir Humphry Rolleston, Bt., G.C.V.O., K.C.B., M.D., D.Sc., D.C.L., LL.D. Vol. II, *Apraxia—Carriers in Infective Disease.* (Pp. 767, illustrated.) London: Butterworth and Co. 1936.

The second volume of this work maintains the uniformly high standard set in the first. The editorial team are to be congratulated on their choice of authors for the special subjects, and on the manner in which the articles are set out. By means of cross-headings a summary of the subject may be seen at a glance, and the particular information required is readily obtained. The articles are worth reading as a whole, however, and give an up-to-date statement of the present position of British medicine.

The subjects covered in this volume, AP-CAR, naturally contain much about the brain. A full discussion of regional diagnosis of brain lesions by Dr. F. M. R. Walshe precedes a very satisfactory account of brain tumour, from the medical and surgical aspects, by Dr. C. P. Symonds and Mr. Hugh Cairns, and Dr. Walshe reviews vascular disorders of the brain. The same author does birth palsies and ataxy, and these with articles by Dr. J. Purdon Martin on athetosis and Argyll Robertson pupil, and by Dr. Macdonald Critchley on apraxia, contain all the information required. This characterizes the articles as a whole, and Professor Hume's account of arrhythmia is a model of saying clearly in short space all that is known. He is guarded enough to leave open what is still in doubt, as in the discussion of the actual side involved in the distinctive electrocardiograms which are accepted as evidence of branch-bundle block, and which at present are best designated as Type I and Type II. Dr. Lakin succeeds in bringing into clear relief the difficult subject of types of peripheral arterial disease and degeneration. It is especially cases of chronic arteritis or decrescent change that are important to recognize early. In senile arteriosclerosis without increase of blood pressure or cardiac hypertrophy it is the diastolic pressure rather than the pulse pressure (the difference) that is likely to be high (p. 60). Much of the difficulty of diagnosis lies in the fact that the adaptability of other vascular areas is so great that a high degree of arteriosclerosis may be met with in some restricted area of the arterial system without any obvious influence on blood pressure. The subject of arthritis and rheumatic diseases generally is discussed from the modern point of view, and a good account is given of present-day opinions and methods. The editor has succeeded in co-ordinating his team of contributors so that the picture is complete without overlap or discrepancy. Mr. Timbrell Fisher's article on osteo-arthritis is practical and helpful, while the subject of backache and lumbago, its diagnosis and treatment by all the available methods, is fully dealt with by Dr. J. B. Mennell.

Two articles, encyclopaedic in conception and result, on the relation of arthropods to disease and on bites and stings, by Drs. Patton and Hamilton Fairley respectively, set a high standard for the sections on tropical medicine. Dr. Fairley's contribution on bilharziasis is that of an expert on the subject. Blackwater fever, beri-beri, and bartonellosis are adequately dealt with by other members of the active London School of Tropical Medicine. Dr. Arkwright's article on carriers in infective disease is sound and practical. Dr. Arthur Hurst sketches a vignette on

was not maintained and the final readings were not lower than would have been expected as a result of prolonged rest in bed

Case Histories from the Rheumatic Group

Case 1.—A patient aged 30 with spondylose rhizomélique had had ten years' history of increasing pain and stiffness in the back spreading to other joints. On admission there was general muscular atrophy and joint fixation but no focal sepsis or history of gonorrhoea. The temperature, pulse, respiration and nervous system were normal. An x-ray examination of the spine showed complete ankylosis with ligamentous calcification. In both hips and the right shoulder there was complete ankylosis; in the left shoulder and knees there was less complete ankylosis. The bones of the carpus

it is inadequately standardized, it "measures" no "trait," and its interpretation is largely subjective Yet the Rorshach is perhaps the most valuable weapon we have in the clinical approach to personality problems Certainly it is of far greater use than the many question-and-answer methods which Dr Cattell has listed so completely, the direct questionary approach to psychological patients is rarely useful and often dangerous, what physician would submit to a psychoneurotic a list of twenty leading questions dealing with his possible symptoms?

Plainly the gulf between the statistician and the clinician is a wide one, and nowhere wider than in the field of dynamic psychology Equally plainly there will come with increasing knowledge a narrowing of that gulf Meanwhile the clinician may be grateful to Dr Cattell for his statement of an opposing case, and may feel that in stating it he has added to the common store of knowledge, and in doing so has helped to bridge the gulf

THE THYROID

The Thyroid Surgery Syndromes Treatment By E P Sloan, M D (Pp 476, 99 figures 45s) London Baillière, Tindall and Cox 1936

The prevalence of goitre in the Middle Western States of North America is indicated by the figures of the Sloan Clinic at Bloomington, Illinois, which has dealt with 20 000 cases in seventeen years, 15,000 patients were submitted to operation in this period, and the experience gleaned from their treatment has been recorded by Dr E P Sloan in his book The reader is warned that certain of the views expressed about the principles underlying thyroid surgery differ in many respects from the commonly accepted teaching, and we must say at once that the book cannot be recommended to students Those who are already familiar with the physiology and pathology of the thyroid gland may find in it much to provoke thought and even to challenge the beliefs upon which their practice is founded, but the less experienced may be bewildered by the vague circumlocutions which abound throughout the work

Dr Sloan's hypothesis to explain hyperthyroidism is that the thyroid normally secretes iodized colloid and a body which he has named "thyrom," the existence of which he infers from the fact that thyrotoxin contains 65 per cent of iodine 'The other 35 per cent" is thyrom, and since in toxic goitres the iodine content of the gland is diminished he supposes that there must be a proportionate increase in the secretion of thyrom, which produces the signs and symptoms of hyperthyroidism It is significant that Harrington's name is not mentioned, and we must be pardoned for doubting the authenticity of the author's biochemistry His suggestion that degenerated tissue in the thyroid may also produce a toxic substance shows how profoundly his ideas differ from those of most pathologists

On the clinical side also a number of rather confusing syndromes are described and attributed to different toxic agents so that in all departments Dr Sloan is out of harmony with the present-day efforts to unify rather than to multiply the causes and symptoms of thyroid dysfunction and he has not considered Dunhill's more acceptable explanation of the relation between the clinical features and the pathological changes in the thyroid gland In a book which is intended to be a comprehensive review of thyroid disease more attention should have been paid to the work of distinguished workers abroad

The technical details of thyroid surgery are well described but it is most disappointing that we should be told nothing whatever about the results of the enormous number of operations performed at the clinic The remarks on malignant disease of the thyroid gland are meagre and inaccurate, and the parathyroid glands are incorrectly described and illustrated This is a big book on a special subject, and we are left wondering how it is possible to write so much without making any substantial contribution to knowledge

Notes on Books

F LE GROS CLARK and L NOEL BRINTON, in their little work *Men, Medicine and Food in the U S S R* (Lawrence and Wishart, 5s net), give an instructive survey based on their personal observations in Soviet Russia and their conversations with the health authorities of the active campaign against disease, especially typhus, typhoid, plague, cholera, and malaria, provision for sickness, the food problem in all its aspects, including inspection and laboratory work, and the physical condition of the people The interest taken by the Soviet Government in the healthy development of the children is indicated by the fact that the number of infant welfare centres in the Union rose from under 1,000 in 1927 to over 2,500 in 1932 In 1922 a State Scientific Institute for Maternal and Infant Welfare was founded in Moscow and in the course of the next ten years most of the regions of the U S S R had their own centres According to the authors the Soviet policy has always allotted the best available food to children, at least in industrial areas, in spite of food often being very scarce Moreover, the child from an early age is given instruction in hygiene and nutrition A bibliography of recent literature is appended

In *Notions de Médecine Aéronautique* Dr JEAN LEDUC has produced an excellent and useful book, and it is to be hoped that an English translation will be forthcoming in the near future The book is written primarily for nurses engaged in air-ambulance work It is divided into two parts The first deals with such subjects as the effects of altitude, air sickness, intoxication by fumes, and indeed the whole field of the pathology of aviation and the special therapeutic measures applicable Instructions follow for the appropriate arrangements indicated in the air transport of sufferers from various maladies The second part covers such topics as the medical supervision of aerodromes, aircraft, and flying personnel, organization of air ambulance services, medical consultations by wireless, and the epidemiological role of the aeroplane This admirable book is practical, concise, and informative, and it should prove acceptable to all who are concerned in the medical aspect of aviation It is published by the author, 8, Rue de la Cannebière, Paris, at 20 francs

The seventh edition of *Public Social Services* (National Council of Social Service, 26, Bedford Square, W C 1, 2s post free) incorporates the latest Acts of Parliament and Regulations dealing with this subject, including those concerning unemployment assistance which came into force on November 16, 1936 This concise handbook should be a boon to the busy practitioner, providing a ready guide to those branches of legislation which have a direct or indirect bearing on his work The book deals with public health, national health and pensions insurance, old age pensions, and the Poor Law, chapters are also devoted to education, industry and employment, administration of justice, and war pensions Where procedure differs in England and in Scotland the differences are pointed out In addition to the information on the above services, which are administered under the Government, there is a short reference to industrial assurance, a subject of much importance to the wage-earning community The book not only describes the various enactments and their methods of administration, but also gives the names and addresses of authorities to whom inquiries and appeals may be submitted The whole arrangement is practical and concise, while a very complete index renders every item readily accessible

done to determine exactly what value radon has in the treatment of gout

The erythrocyte count however showed a tendency to fall when large doses were employed in certain instances to a serious degree It appears therefore that with large dosage the administration of radon is attended by definite risk, and it should be administered with great caution

PSYCHOLOGICAL FACTORS IN RHEUMATISM

A PRELIMINARY STUDY

BY

JAMES L HALLIDAY, M D, D P H

Regional Medical Officer Department of Health for Scotland

PART I

Psychological factors play an important part in initiating and maintaining illness especially those forms of illness which are grouped under the heading of general medicine This is widely accepted but is vaguely understood This paper is therefore prefaced with a brief account of the ideas underlying the term 'psychological factors' as related to illness

Psychological Factors

An individual enters the world with a particular structure, a particular chemical and physical make up and a particular mode of behaviour This idea is sometimes put in another way by saying that he inherits a certain constitution (which refers especially to structure) a certain diathesis (which refers especially to chemistry and physics), and a certain pattern (which refers especially to behaviour) Among the patterns which he inherits from his ancestors his race and his species are those which drive him to behave as a human being These patterns of behaviour are often called instincts They include the deep seated instincts common to all animals—namely, those of self-preservation—with the drives to eat, to drink, to fight, and to escape, and those of sex—with the drives in the earlier years to love the mother, and later to mate and to succour the offspring The more distinctively human tendencies include the drives to create and to construct in the physical world of things or in the mental world of ideas

As an individual grows in time he meets things forces, and happenings to which we give the name environment As he meets new factors in his environment he reacts to them and sometimes he reacts in such a way that he is described as ill Illness is not an external object which a person catches, but is a reaction on the part of the individual to factors of his environment The environmental factors which provoke a reaction of illness belong to two groups First, there are those which the individual meets by direct contact of his body tissues These include the physical agents of mass (which causes trauma), of light heat, wet and cold chemical agents such as drugs poisons and foodstuffs and biological agents such as micro organisms Secondly there are the factors which frustrate or threaten to frustrate the instincts and drives of the individual as, for example the death of a loved person being jilted financial loss or unsuitable occupation The individual does not encounter such factors by direct bodily contact but through his mind and because of this they may be called psychological to distinguish them from physical factors The study of how the individual reacts by illness to psychological factors is called psychopathology This science is still in its infancy and is complicated However from the standpoint of general medicine it is convenient to consider the problem in simple terms and we can increase our understanding of illness enormously if we realize that when the instincts are frustrated emotion is manifested

Emotional Reaction

The bodily mechanism of emotion consists of the triad of the primitive brain the autonomic nervous system and the endocrine glands By means of this mechanism psychological factors may affect an individual profoundly bringing about changes in chemistry rhythm secretion, and even structure in the whole of the body or in any part of it This may be illustrated by considering the emotion of grief which is the response to the loss of a person or object that has been loved

The acute phase of grief may last for days or for weeks and is spasmodic or paroxysmal in its effects The symptoms are numerous and vary from person to person They may involve every vegetative system of the body The classical symptoms include tears sobs choking sensations twitching of the lips and hands pulling down of the corners of the mouth obliquity of the eyebrows a general sense of coldness distaste for food (especially flesh foods and milk) with a feeling of the food sticking in the gullet and the heart turning to stone or breaking This last is a feeling as if some foreign body like a lump of rock or iron lay heavily under the left chest wall and with each movement or even with each respiration dull jags are experienced as if the heart were a stone with broken edges Also and this is a point of importance to the subject-matter of this paper the sufferer between the paroxysms of grief feels sore and stiff as if he had been thrashed

With the passage of time these bodily disturbances may subside on the other hand one or more of them may be maintained in the original or in a modified form For example in the respiratory system the chokings and sobs may merge into asthma in the cardiovascular system the pain of the broken heart into angina and palpitation and the coldness into vasomotor disturbances of the extremities in the alimentary system the loss of appetite and the sticking of the food may merge into anorexia regurgitation vomiting and in the locomotor system the soreness and the stiffness may merge into rheumatism I have seen examples of all these among insured patients who had never suffered from any of those disorders until they had encountered a bereavement and reacted with the emotion of grief

In such instances the patient's attention was no longer focused on his bereavement but was dominated by his symptoms which he interpreted as evidence that he was diseased in the part of the body affected It may be added that it is doubtful if grief ever occurs in pure form It is almost always accompanied by anxiety which is associated with other emotions such as fear (for example concerning the future) resentment (for example against a person an institution or even a mental concept such as justice or the idea of God) and a sense of guilt Regarding the last Charles Darwin (1872) wrote Under the sudden loss of a beloved person one of the first and commonest thoughts which occurs is that something might have been done to save the lost one— It was my fault and I should never have left him Similarly also Groddeck (1929) a German physician who was one of the first medical men to take an interest in psychological factors in organic disease wrote In our civilized society everyone whose mother has died believes that he or she is guilty of her death believes it even when the mother has died in a place far removed The bodily effects of anxiety are not infrequently found in psychoneurotic

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JANUARY 30 1937

THE WELLCOME TRUST

Many years ago a book was published in America under the title *Inspired Millionaires* Instead of denouncing those who had accumulated enormous wealth an endeavour said the author, should be made to inspire them The process of inspiration has certainly had some success, especially in the country of Rockefeller and Carnegie The British public has scarcely recovered its breath after the Nuffield benefaction to Oxford before another great philanthropic endowment, of a different character but directed to similar ends, is announced in the shape of the Wellcome bequests A letter in our correspondence columns from the five trustees appointed under the will of Sir Henry Wellcome, who died in July last, explains that after some personal provisions have been made, including a memorial in Minnesota to the testator s parents, the whole of the divisible profits in Wellcome Foundation Limited will be utilized in two categories—namely, a "Research Undertaking Charity" for the advancement of medical and scientific research, and a "Museum and Library Charity" for the establishment or endowment of research museums and libraries The Wellcome Foundation was established in 1924 by Sir Henry Wellcome to take over the business of Burroughs Wellcome and Company, manufacturing chemists, with their subsidiary companies in other parts of the world, together with the Wellcome Research Institution, which includes the physiological and chemical research laboratories and the museums of medical history and medical science in London bearing Wellcome s name, as well as laboratories elsewhere Although for convenience Sir Henry Wellcome registered the Foundation as a limited company he was its sole possessor

Unlike most other great legacies, the Wellcome gift cannot be estimated in actual figures A statement appeared in the Press that it represented the income from one million pounds of industrialized capital or probably substantially more—a figure no doubt suggested by the fact that the company was registered with a capital of one million one pound shares No information is really available, outside the directorate of the Foundation, on which an estimate can be based The point is, however, that here we have dedicated to research, not a fixed sum in trustee securities, but the profits and goodwill of one of the best-known businesses in the country, enjoying a high reputation, with interests more or less all over the world It will be run in future, not for private nor even for co-operative profit, but for the endowment of medical and allied scientific research and the upkeep of scientific institutions Bequests, even on the grand scale, are not infrequent, but businesses dedicated in perpetuity are rare One instance of which we have been reminded is to be seen at Copenhagen in the Carlsberg Foundation Here the founder and proprietor of a brewery originally started research laboratories for the benefit of his business, and at his death left a large part of the earnings of his very successful brewery to trustees with such wide discretion that the Foundation has been a fairy godmother to sciences and arts having little connexion with the actual business of brewing In the Wellcome bequest, however, the machinery whereby the revenues are earned is in character with the purposes to which they will be devoted, although the purposes, of course, spread out over a much wider field It may be reasonably pointed out that commercial undertakings, however well established, have usually a short life as compared, for example, with ecclesiastical and university institutions, but those who in future turn expectantly to the largesse which the Wellcome trustees may be able to distribute will not be depressed—and will have no reason to be—by doleful predictions based on the insecurity of commercial and industrial affairs

By the terms of the will the Foundation remains under a board of directors, the managing director at the time of Sir Henry Wellcome's death, Mr George E Pearson, becoming governing director The function of the five trustees appointed is not to concern themselves with the detailed conduct of the business, which calls for expert direction, but to act as the equivalent of a body of shareholders, holding the property on behalf of those whom the testator intended to benefit and distributing the dividends according to his directions The will directs that two of the trustees shall always be men of standing and authority in medical and allied scientific research No more fitting choice could have been made than Sir Henry Dale, director of the National Institute of Medical Research, who for ten years, from 1904 to 1914 was associated with Sir Henry Wellcome as director of the Wellcome Physiological Research Laboratories, and Professor T R Elliott (in place of the late Sir Walter Fletcher, who was first nominated) of University College Hospital Sir Henry Wellcome was concerned for the soundness of the research which his gift would make possible There is an italicized statement in the will, that "persons of rash and speculative tendencies should be barred"

Pain as an Expression of Inferiority

To encounter a disease or an injury includes not only the experience in the body but also the experience in the mind in the form of knowledge or fear

Knowledge and fear of morbidity are acquired in popular beliefs in attending hospitals in reading in meeting doctors who talk about conditions and slight weakness and who give labels to patients in the absence of probability and also in seeing relatives friends or fellow workers affected with certain diseases A common disease encountered mentally is kidney trouble Many persons who experience backache whether through fatigue physical exertion or anxiety become afraid that they have kidney disease Every doctor in practice knows how patients who come to consult him about pain in the back almost invariably bring with them a bottle of urine whereas it is very rare for patients with other complaints to do so

These encounters however do not bring about emotional reaction unless the patient is for some reason or other already anxious and therefore suggestible For example a workman will become ill with pains in the abdomen and be labelled gastritis after a fellow workman has told him how he had an operation for gastric ulcer and has demonstrated to him his belly slit open from here to here but he will not usually do so unless he is already harassed by domestic financial or occupational difficulties Pains associated with fears of disease not uncommonly appear especially at first when the patient is sleeping and they wake him a few hours after he has gone to bed Nocturnal onset is a characteristic of symptoms of emotional reaction not only of pain but of other bodily disturbances such as numbness cramps loss of power itching choking sensations and palpitation It may be described in psychological terms by saying that the disagreeable situation and the associated emotions are repressed by the waking mind but when conscious control is relaxed during sleep the disturbing situation is free to manifest itself in the form of dream imagery and the associated emotions in the form of bodily disturbance To sum up inferiority may be inherited or acquired Acquired inferiority may be either physical or mental in the form of knowledge and fear

Pain and Stiffness as Symbols

We have considered how a site may be chosen for pain because it was inferior either in a physical or in a mental sense There is however another way whereby a symptom may be attached to a part of the body and the mechanism involved is known as symbolization A symbol is something which stands for a mental experience it represents what a person perceives or feels or desires or thinks Words whether written or spoken are examples of symbols Thus when the word hen is uttered we understand by that sound a certain perceptual experience of shape colour sound and smell Body gestures are also symbols If a man in silence spits at a person who is walking along the street that gesture is a symbol which is readily understood It expresses his feelings towards the person—namely disgust and contempt interpreted in verbal symbols—translated into words—it means *I do not want you I am ejecting you* The use of spitting as a symbol of contempt is common to the human species independent of time place or spoken language it is valid from China to Peru and in that sense it may be described as a species or collective symbol

Bodily symptoms may also represent symbols which when correctly interpreted tell a great deal about what the patient has perceived has felt has desired or has thought For example we have already discussed how a complaint of jagging pains and dull weight in the region of the heart may mean *My heart is sore my heart is heavy my heart is broken* The symptom of pain in the absence of an organic cause may be a symbol which signifies *My feelings are hurt* For example I remember a decent working man aged 50 who had complained of generalized pains and stiffness had been labelled rheumatic but who showed no evidence of structural changes Inquiry showed that he had worked with the same firm from the age of 14 and that about three months before the onset of his illness he had been dismissed owing to cutting down of staff After relating the story of his dismissal he himself interpreted his symptoms by saying *Aye doctor, I took it ill I felt it sore* after all these years with the firm, *I thought it stiff*

Note—Such symptoms have been called body language—the person is relating his mental experiences not in verbal symbols but in terms of bodily dysfunction Thus vomiting may mean I am sick of something or somebody Coughing may mean There is something inside me and I cannot cough it up Fainting may mean I am faint hearted Frequency of micturition may mean I am in a piddling funk The list is endless and extends from the crown of the head (light headedness and giddiness meaning I am uncertain which way to take so I go round and round) to the soles of the feet (I am foot ore and weary) Interpretation of such symbols is sometimes difficult but sometimes it is surprisingly easy For instance there was the woman who complained of something sticking in her throat She was thoroughly examined by throat specialists and no structural changes were found Inquiry into psychological factors showed that her symptoms began three months previously after a neighbour had called her a prostitute The interpretation of her symptoms is I received an insult I failed to swallow it it is still sticking in my throat. Again there was the woman who had lost her voice Inquiry showed that she was a good living Churchwoman and that she had lost her voice after learning that her unmarried daughter had fallen pregnant The interpretation of this symptom is It is unspeakable I cannot talk about it no one must hear it Then there was the man who complained of continuous vomiting which dated from the imprisonment of his son who had always been a source of difficulty His vomiting signified I am sick of him I am spewing him out of my mouth because he is not my son and does not belong to me any more

Limitation of Movement as a Symbol

The gesture of spitting has been mentioned as a collective symbol of contempt and disgust It is an example of what Darwin (1872) called an expressive action He wrote The chief expressive actions exhibited by man and the lower animals are innate or inherited The young and old of different races both with men and animals express the same states of mind by the same movements Such movements cannot be said to depend on the will of the individual Limitation of such expressive movements associated with pain and spasm of the musculature may also be symbolic An interesting example is limitation of spinal movement The spine is the part of the body which holds the human individual erect and in the mind of the species—the collective unconscious as it has been called—the spine signifies ideas related to uprightness and pride A proud man wrote Darwin exhibits his sense of superiority over others by holding his back and head erect (So also does a dog I remember observing the behaviour of my fox terrier after he had killed his first rabbit He swaggered with pride His body arched earthwards with the muscles all a ripple down his back and his head was in the air) In the following description of limitation of spinal movement the lumbar region and cervical regions are considered separately although as we shall see the symbolic significance is fairly similar

Lumbar Limitation

A complaint of pain and inability to bend is in the absence of structural change or inferiority not infrequently a symbol Sometimes it signifies *I am an upright man I do not stoop to do such things they are beneath me* Sometimes it means *I am a proud man I do not bend I do not lower myself I am above these things* It will be noticed that there is little difference between the upright man and the proud man they both act in the same way and say the same things Pride in its extended sense of superiority includes not only uprightness but also independence and self-respect Patients ill

that of Dr R H Crowley at University College, London From time to time indeed the suggestion has been made that biology should be the basic or pivotal subject on which all education should be constructed or from which all other subjects should radiate This can be maintained with considerable force, and at any rate there can be few to day who would deny Professor Stopford's statement that "some knowledge of biology is a necessity for all of us," or Dr Crowley's dictum that "full physical fitness is impossible unless a sound biological foundation is first secured" Yet even now it is true that biology is only struggling—though struggling successfully—for a place in the school curriculum Professor Stopford describes it as the "Cinderella of the sciences offered at school," and Dr Crowley ascribes this to the dominance of "the examination system, which in the past had been the servant and was now the master"

It should never be forgotten, however, that the advocacy of a more prominent and more common position for biology in the schools is based primarily upon general cultural and not upon utilitarian, technical, or examinational grounds, and that much pedagogic wisdom and vigilance may be required to keep the teaching of biology upon right lines, and to prevent its deterioration, as that of chemistry and still more of physics have to a considerable extent deteriorated in many schools, into a sort of minor technological training in laboratory work or merely a fresh field for exercises in mathematical calculation As Professor Stopford says, "Biology properly taught has a profound humanizing influence" It provides a link with a large number of other subjects—history, geography social and domestic science at once come to mind It is the best introduction to the teaching of science in general, its methods of observation, of selection of patterning, of the formulation of "laws," of the control of "nature" Biology as the study of living things and as one of those sciences which are at present at any rate not "exact" has a truer educational value than others The exclusive study of the more exact sciences of physics and chemistry may lead to an undue confidence in particular procedures, to a set and rigid frame of mind, to a lack of interest in human affairs, to the manufacture of the efficient technician rather than of a really educated man or woman If Dr Crowley is right in defining the end of education as "learning to live" there can surely be no doubt as to the position which the science of life should have in the school curriculum

The position of biology in relation to the medical curriculum has never been so clearly envisaged, and yet there need be no confusion with regard to it It is not difficult to distinguish between biology—along with physics and chemistry—as an "introduction" to human anatomy and physiology and the understanding of human environment on the one hand, and its "application" to these medical scientific subjects on the other The application of the three preliminary sciences must continue throughout the curriculum just as the application of anatomy and physiology must continue throughout the three clinical years It is at least equally obvious that the general study of a subject which introduces the student to another should be undertaken before and not *pari passu* with that of the subject to which it is an introduction It remains a distinct and considerable blemish upon the medical course, as newly prescribed by the General Medical Council, that the study of general biology, wherever it may be pursued, should not in every case be made to precede the entry upon the medical curriculum proper

CONTROL OF PITUITARY SECRETION

With increasing knowledge of the hormones of the pituitary gland it has become imperative to understand the mechanisms that control the formation of these principles within the glandular elements The pituitary gland is unique in that it seems to be responsible for the control of all endocrine activity either directly or indirectly Collip has gone so far as to refer to it as "the master gland" This does not mean that the pituitary gland, while influencing endocrine activity elsewhere is not in itself influenced by the secretion of other endocrine glands—for example, the changes in the pituitary as the result of castration are profound Therefore to some extent it can be said that there is an interplay of endocrine activity which tends to preserve the normal state It has been known for many years that the pituitary gland receives a dual innervation first by nerve fibres from the hypothalamus which enter the gland along the hypophyseal stalk and, secondly, by fibres arising in the superior cervical ganglion which pass to the gland by the perivascular route (mainly along the internal carotid artery) Roussy and Mosinger[1] have drawn attention to the possible significance of this double innervation in the control of pituitary secretion It cannot be said that their paper has simplified the problem for they have not taken into consideration questions of the first importance It is possible that instead of active principles inactive precursors of these may be elaborated in the gland cells under the control of the hypothalamus or other endocrine glands These principles may not be activated and thrown into the circulation until the necessary stimulus arrives over the second nervous pathway—that is, from the superior cervical ganglion Recent work on the relations of the hypothalamus, pituitary gland, and superior cervical sympathetic ganglion in carbohydrate metabolism is capable of this interpretation, which however, may not hold good for every hormone In a recent paper on diabetes insipidus J H Biggart[2]

[1] *Presse méd* 1936 79 1521
[2] *Brain* 1935 58 86

The neck in the collective unconscious represents ideas relating not only to pride (and its correlatives uprightness independence and self respect) but also to refusal obstinacy, and self will A complaint of pain and stiffness in the neck with inability to bow the head is sometimes found to be an attitude of refusal—a symbol which signifies *I am stiff necked I cannot bow my head I resent this person and this situation I am obstinate and self willed*

Here is a point of special interest If anyone cares to adopt the attitude of refusal ' and to persist in it—that is to say, if he throws back his head and shoulders and maintains the position for several minutes he will experience dull and cramp like pains which are most marked in the region between the upper parts of the scapulae This is a not uncommon site for a complaint of aches and pains with no discoverable organic basis Inquiries into psychological factors not infrequently show that pains in this site develop in the course of an anxiety state and are an expression of pride (in its extended sense of superiority) and of refusal resentment, or obstinacy Such pains occur perhaps most typically in married women who become widowed and are faced with the prospect of living in reduced circumstances or of taking up some occupation as a means of livelihood but they are also to be found when a person for any reason gets it in the neck

Note—To get it in the neck is a slang phrase with which everyone is familiar A person is said to get it in the neck when he receives a definite shock to his happiness his comfort, or his security as a result of encountering some deprivation or misfortune Also perhaps there is a suggestion that the deprivations and misfortunes are not single but multiple I have been unable to trace how or when the phrase arose but it was certainly extensively used during the Great War Whatever its origin its aptness has been recognized and its use is now widespread The reasons for this are probably to be found not so much in any conscious associations (as for example with hanging or with the guillotine) as in unconscious associations A man who meets with a deprivation may do one of two things He may resent it or he may accept it if he resents it he throws back his head if he accepts it, he bows his head Whichever he does the neck is involved

Another slang phrase involving the use of the word neck is X gives me a pain in the neck or more commonly, X is a pain in the neck This apparently nonsensical phrase has obtained a wide currency It means that X is found to be a depressing or boring individual and is not acceptable Thus if someone in a company refers to X and another person says Oh X! He's a pain in the neck! and it can be noticed how everyone throws back his head and no one mentions X after that. In this way X is refused admittance to the company with a No symbolized both in slang and in gesture

Examples of cervical limitation and pain are included in the following serial investigation of patients with "rheumatism" involving the neck and shoulders

PLASMODIUM OVALE INFECTION CONTRACTED IN DIFFERENT PARTS OF WEST AND CENTRAL AFRICA

BY

P MANSON-BAHR, D S O, M D, F R C P
Physician to the Hospital for Tropical Diseases London

AND

W J MUGGLETON
Laboratory Technician

Although probably *Plasmodium ovale* infections in man are widely diffused throughout Central Africa, having now been reported from a wide belt extending from Northern Nigeria to Kenya Colony yet remarkably little has been written upon the distinctive clinical manifestations which tend to differentiate it from infections with other forms of malaria parasites At the present moment *P ovale* appears to be purely an African species, and there is only one exception to this in the case reported by P Muhlens from ' Western South America N H Fairley (1933), in the record of his case appears to be the only authority who has paid special attention to the clinical aspects of the naturally acquired infection with *P ovale*

Four cases of this infection have occurred in the course of practice during the last two years two in males and two in females The infection had been contracted respectively in Uganda, Nigeria Belgian Congo and Sierra Leone The main clinical characteristics so far as could be ascertained, are the comparative mildness of the infection and the almost invariable recurrence of the rigors and fever during the course of the evening in contradistinction to the usual morning rise of temperature in other species of malaria Abdominal pain referred to the appendix area had led to a diagnosis of appendicitis being made on clinical grounds in three out of the four cases whilst in the fourth the pain was referred to the left loin and was thought to be due to a renal calculus Subsequent to operation for the appendix rigors occurred and resulted in the demonstration of typical *P ovale* parasites in the blood

This observation may be considered to be of some practical importance, although the same phenomenon of 'pseudo appendicitis has frequently been observed in *P falciparum* infections Another clinical characteristic of diagnostic value in these *P ovale* infections is the rheumatic pain in various parts of the body, especially in the lumbar region One case had actually been diagnosed as rheumatic lumbago

Report on Four Cases

Apart from these phenomena malaria due to *Plasmodium ovale* is a particularly mild disease and is very amenable to quinine or atebrin treatment. The following is a short summary of the cases

Case I

A woman from Uganda had had mild attacks of malaria there in spite of regular prophylactic doses of quinine An attack of fever on October 22 1933 had subsided without treatment. She had complained of pain in the small of the back and over the appendix region and an operation was performed on October 29 for appendicitis A rigor followed on the evening of October 31 with a temperature of 103 F When seen on the morning of November 1 the temperature was normal and the spleen was just palpable A blood film showed half grown and gametocyte forms of *P ovale* 5 c cm of the blood was sent to Colonel S P James at Horton where the parasite was recovered and was used for thera

the minimal air of the lung was replaced by the various solutions they used casts doubt upon the belief that air is entrapped by collapse of the smaller bronchi, rather is it probably associated with incomplete collapse resulting from damaged elastic fibres due to death Absence of atelectasis in the presence of twelve blocks of major bronchi and numerous blocks of smaller bronchi, many of which were of long standing, lends support to the theory of interlobular air communications Finally, the authors emphasize that repeated injections of lipiodol may be needed in suspected cases of bronchiectasis, since occasional entrapping of the air by their dye occurred, and that absence of alveolar filling may be found with dilated bronchi when the latter contain enough pus to produce occlusion

HEALTH POLICY IN PALESTINE

The annual report for 1935 of the Department of Health in the Government of Palestine contains much interesting information The general administrative policy of the Department has been one of decentralization, responsibility for medical and health affairs being vested as far as possible in the British senior medical officers in charge of the four medical divisions Under their administrative control Palestinian medical officers carry out the routine work of hospitals and clinics, and also of sanitary measures This policy has enabled the Department to concentrate its energies on the reduction of preventable diseases, the improvement of general sanitary and health conditions, and the medical supervision of school children and infant welfare work Progress is hampered, however, by lack of adequate funds, and the allocations for special purposes are far too small, while it has not yet been possible to make any provision for tuberculosis During the year under review there was an increase in the total incidence of malaria, attributable to an unusually heavy winter rainfall As an example of the extent of antimalarial measures it is recorded that 169,228 potential mosquito breeding places were registered, and over 2,800 000 inspections were made Oil was applied on 800 000 occasions 330 pumps were fitted, and 9,300 places were mosquito proofed A number of extensive drainage schemes were also undertaken *Ankylostomiasis* investigation has shown that the conditions of warmth, moisture, and soil associated with citrus cultivation are favourable to the development of the parasite In the Jaffa district measures of sanitation and treatment carried out on a large scale only resulted in a 5 per cent reduction of incidence It is considered that the lack of sanitation in the orange groves themselves may to some extent be responsible for maintaining continuous reinfection among the labourers employed There were 2,060 cases of typhoid with 204 deaths, a small increase on the figures for the previous year, 400 cases occurred in Haifa alone Overcrowding is prevalent in the larger towns and sanitary progress has been unable to keep pace with the increase in population A disquieting feature is the *continued penetration* of the disease into rural areas, formerly comparatively free as a result of cheap transport and the flow of labour into the towns from surrounding villages

BACTERIAL ENDOCARDITIS

Although pathological and clinical researches have revealed much of the natural history of bacterial endocarditis, many problems concerning this mysterious disease still await solution Dr Bruce Perry in a recent monograph[1] traces our knowledge of this malady from one of the earliest clinical descriptions in 1707 to the present day Much bacteriological work has been done on this disease, and the author has undertaken *an analysis of a composite group of 1,000 cases* Streptococci were found to be responsible for 68 per cent, while the pneumococcus and staphylococcus were approximately of equal aetiological importance, with 11 per cent and 10 per cent respectively The gonococcus and *H influenzae* were together responsible for about 7 per cent The clinical descriptions have been assembled from the author's experience, together with references to the more important series and cases from the literature While so much knowledge has been accumulating in respect of aetiology, bacteriology, and the local and constitutional effects of the disease, it is disappointing that so little can profitably be said about treatment For in spite of auto-haemotherapy and sera and vaccines and intravenous antiseptics the diagnosis of bacterial endocarditis implies the existence of a malady almost invariably fatal Dr Bruce Perry gives an up-to-date and readable survey of the subject

CENTENARY OF LEOPOLD VON SCHRÖTTER

On January 30 the centenary of Professor von Schrotter will be celebrated by the University of Vienna and the Vienna Laryngological Society Born on February 5, 1837 he was one of the pioneers of laryngology, and some of his researches and methods still hold Schrotter was the founder of the department and the first professor of laryngology in the University of Vienna, which was the first special clinic in the world to be established with a chair in a university He also took a particular interest in the modern campaign against tuberculosis At Alland, near Vienna, he founded one of the first open-air sanatoria At the celebrations at the end of this week a memorial medallion of Schrotter will be unveiled and the rector of the university (Professor Arzt), the dean of the faculty (Professor Kerl), Professor Sorgo (a former assistant) and Professor Marschik, the president of the Laryngological Society, will deliver addresses Many of the senior laryngologists of this country will remember with affection this genial professor and his remarkable command of English He last visited London during the Congress of Tuberculosis in 1901 He died in 1908 at a dramatic moment when he was presiding over the International Congress of Laryngology in Vienna

Owing to reconstruction work at the Royal College of Surgeons of England it has been found necessary to close the Museum for an indefinite period It is hoped, however, that it may be possible to reopen the Museum towards the middle of March

[1] *Bacterial Endocarditis* By C Bruce Perry, M D, M R C P Bristol J Wright and Sons (10s 6d)

deep sensation were unimpaired The patient showed no evidence of any toxic effect from the drug except for slight nausea about one hour after administration In order to complete the investigation a subcutaneous injection of novocain was given with the production of normal local anaesthesia

We concluded that this was a definite case of rachi resistance and finally performed lumbar ganglionectomy by the transperitoneal route under general anaesthesia with excellent results

Rachi resistance and Rachi sensibility

Cases which appear to be hypersensitive to spinal anaesthetics are said to be rachi sensible This condition is uncommon but not excessively rare Pathological states such as toxaemia from acute intestinal obstruction, increase in urea content of the blood and jaundice render patients more susceptible to spinal anaesthetic drugs, the physiological state of pregnancy renders women more sensitive to this form of anaesthesia

On the other hand, 'rachi-resistance' is apparently a very unusual phenomenon After a thorough search of the available literature we are unable to find a reference to it in the English language other than in a direct translation (Sebrechts 1934a) Sebrechts (1930) however has paid a good deal of attention to the subject, and the following facts emerge from a perusal of his works

He states that the cases belonging to the group rachi resistant are found to be predominantly sympathicotonic in type, whereas those grouped as rachi sensible are vagotonic in type (1932) This author has also observed that the cases of 'rachi resistance' which have come under his notice have belonged to the same family (one a father and son, the other a mother and four sons) and he is convinced that the phenomenon is of a familial distribution Elsewhere (1934b) he goes so far as to say that it may be a racial property stating that the Anglo Saxons appear to be more resistant than the Belgian population

Discussion

L J Witts (1936) in a recent contribution draws a distinction between idiosyncrasy and susceptibility He states that 'idiosyncrasy is a peculiarity of constitution whereby the individual reacts differently from the majority of mankind In some cases of idiosyncrasy a mechanism akin to anaphylaxis is present an initial dose being necessary to sensitize the patient

An idiosyncratic patient thus exhibits a reaction peculiar to himself, and which cannot be predicted unless the family is suspect For instance if one of a family is found to be rachi resistant —for example a father— and the sons resemble him in type (sympathicotonic) then one might predict that the sons will be 'rachi resistants Thus we venture to suggest that the phenomenon of 'rachi resistance' can be classed as an idiosyncrasy

On the other hand the susceptible person requires a smaller than average dose of a drug to produce the standard effect This is what obtains in those cases which are termed rachi sensible a condition sometimes produced by pathological states, as already mentioned

Is it possible to find an explanation for rachi resistance ? The production of anaesthesia by cocaine and its derivatives is attained by a local depression of nerve fibrils or nerve trunks In the case of the nerve trunks there is a permeation of the drug through the sheath in order to reach the fibrils and Sebrechts (1930) points out that this permeation is more rapid and intense in the spinal nerve roots than in the peripheral nerves on account of the less permeable nature of the sheaths of the latter If one assumes a variation in permeability of the nerve sheaths then those cases of greater permeability will obtain more intense anaesthesia than those in which permeability is present to a lesser degree Toxic products circulating in the system might conceivably increase the permeability of the nerve sheaths thus rendering the subject rachi-sensible If on the other hand an undue resistance to the permeation of cocaine peculiar to the nerve sheaths of the individual is assumed this might account for him being rachi resistant

Clinical Memoranda

Typhoid Abscess 57 Years Later

The typhoid bacillus is well known as a pyogenic organism and one which may be long in producing this effect, in the present case the interval was fifty seven years

Clinical and Bacteriological Report

A man of 68 and a clear witness was admitted to hospital on May 30 1936 with a swelling in the left popliteal fossa which had been present for six months and with a history of some sweating at night for about two weeks before admission His only previous illness was typhoid fever at 11 years and this was fixed in his mind as it came on very soon after a Sunday school outing

There was no history of injury and x rays revealed no bony lesion The swelling was incised and drained of its yellow creamy contents Direct film of this pus showed no *B tuberculosis* or other organisms but on aerobic cultivation at 37 C for eighteen hours a pure growth of *B typhosus* was obtained The patient's blood serum agglutinated *B typhosus* to a dilution of 1 in 50 but no further—a technical positive *B paratyphosus* A and B were not agglutinated The patient's own organism was agglutinated to a dilution of 1 in 125

No pathogenic organisms were obtained from the faeces and urine at two examinations *B typhosus* was again isolated from the abscess two days later but not subsequently the wound healed slowly under antiseptic treatment

Literature

E N Wardle (1935) reported the isolation of *B typhosus* from a bone abscess at the mid length of the right tibia opened at operation in August 1934 on a man aged 54 with a history of typhoid fever ten years previously There was a remote history of trauma The man's serum agglutinated the organism to a dilution of 1 in 125 Wardle also quoted Keen as mentioning a case reported by Buschke in which the organism was obtained in pure culture from a tibial abscess seven years after the fever

Brock (1935) described a case of Post typhoid Chondritis with Abscess Formation in a medical practitioner aged 32 Here a pure growth of *B paratyphosus* B was obtained from

creasing the cardiac output, increasing metabolism, raising the blood-sugar concentration, diminishing fatigability of muscles, raising the oxygen-carrying power of the blood by increasing haemoglobin and red cells, and by diminishing the coagulation time of the blood Such reactions might aid the primitive animal in flight or combat Cannon and collaborators also showed, however, that neither the medulla nor the sympathetic nervous system was essential to life Animals deprived of them were sensitive to cold, and their rage was not associated with hyperglycaemia or erection of hair

Adrenalectomy

Since unilateral adrenalectomy, with destruction of the medulla of the remaining gland, has little or no effect on the health of the animal, a study of the results of bilateral adrenalectomy should give some indication of the function of the cortex This supposition is further supported by the fact that adrenaline injections cannot influence the fatal outcome of the latter operation, whereas cortical extract can

In some species, such as the cat and the dog, the operation is almost invariably fatal and usually within a week In others, such as the rat, accessory suprarenals may prolong survival, sometimes indefinitely With correct technique, including the removal of the perinadrenal fat, there is nevertheless a 100 per cent mortality in most strains if young rats weighing less than 100 grammes are used The results are the same for one-stage or two-stage operations, but the latter may minimize acute fatalities from surgical trauma

In the case of rats recovery from the operation may appear complete within one or two days, and superficially the operated rats may appear no different from the controls, nevertheless sudden collapse and death may take place within a few hours Where the survival period is more prolonged, either spontaneously or with minute doses of cortical extract, the more definite results of cortical insufficiency can be studied A loss of appetite and failure to gain weight adequately are early signs If control rats are given daily an amount of food equal to that eaten by their paired adrenalectomized litter mates it is seen that with the latter there is also a deficient gain of weight per gramme of food intake (Levy Simpson, Dennison, and Korenchevsky) The animals are inert and apathetic, but hyperexcitable when interfered with Their muscle tone is poor, and they are unable to climb the observer's hand when suspended The fur is ruffled dry, and lustreless Infection of the eye and eyelids may be present Diarrhoea and bloody stools occasionally occur, but are rare features except in the terminal phases In the absence of cortin there is a susceptibility to nasal and respiratory affections The rectal temperature is often subnormal, and even when normal falls very rapidly on exposure to cold, which the animals are unable to withstand At necropsy there is a striking absence of abdominal fat, a hyperplasia of the thymus and lymphatic nodes congestion of the viscera, haemorrhagic erosions of the gastro-intestinal tract, and other changes The blood is thick and coagulation time diminished In more chronic insufficiency in cats and dogs there may be a slaty-grey pigmentation of the skin and a chocolate brown coloration of subcutaneous fat

The Cortex and Carbohydrate Metabolism

The blood sugar after adrenalectomy falls acutely just before death and hypoglycaemic convulsions may occur Apart from this terminal drop it may or may not be low according to the species of animal There is, however, a profound disturbance of carbohydrate metabolism, as shown by a decrease in muscle and liver glycogen, the latter being especially severe Probably for this reason excitement, fright, or adrenaline will not produce the rise of blood sugar that occurs in normal animals The adrenalectomized animals are also unable to synthesize glucose or lactic acid into hepatic glycogen There is a high concentration of lactic acid in the blood All these changes are corrected by a cortical extract Britton and Silvette think that the regulation of carbohydrate metabolism is the most important function of the adrenal cortex

The Cortex and Sex

There is strong clinical evidence in support of an association between the cortex and sex Experimentally, hyperplasia occurs after castration in rats, during pregnancy in guinea-pigs, oestrus in frogs, and ovulation in pigeons Adrenalectomy is followed by suppression or by irregular appearance of the oestrous cycle, and by degeneration and atrophy of the testis It is not certain how far this is due to the general metabolic changes and poor condition of the animal, rather than to a specific influence If the animals are kept in a more chronic state of insufficiency there is at first a hyperplasia (? compensatory) of the interstitial cells of ovary and testis, without any degeneration, but later on a gradual atrophy follows The latter would appear to be an indirect effect through the pituitary, since adrenalectomy results in a diminished gonadotropic potency of the pituitary and a decrease in the proportion of its basophil cells Pregnancy prolongs the survival period after adrenalectomy

Injections of cortical extracts have given discordant results Atwell produced enlargement of the ovaries in hypophysectomized frogs, and Corey and Britton precocious sexual maturity in young rats The majority of experimenters have obtained negative results with an extract which was quite potent in preserving the life of adrenalectomized animals Reichstein, however, has isolated from the adrenal gland a crystalline steroid, adrenosterone, with male-hormone properties In adrenal virilism comb growth hormone may be present in excess and in adrenal feminization oestrogenic hormone may be present in excess Callow and Parkes have obtained adrenal extracts that show oestrone-like and progesterone-like activity

It is important to remember that in the adrenal of the human foetus and of some young animals there exists a large zone between the cortex and medulla which is called the androgenic zone, because of a probable relation to the gonads Thus in the mouse this zone disappears at puberty and in the male adult mouse hypertrophies after castration (Howard, Deanesly) It also involutes in the female mouse during pregnancy The presence of this zone has not been observed in the dog cat, rabbit, or cow In man it involutes rapidly after birth, and it is postulated (Grollman) that the cells of the rudimentary androgenic zone are the ones that undergo hyperplasia in virilism and pseudohermaphroditism

The Cortex and Mineral Metabolism

An important function of the adrenal cortex is the regulation of the balance and excretion of sodium and chloride Adrenalectomy results in an increased excretion of these two elements and a fall in their serum values There may be an initial diuresis and subsequent oliguria, but the water excretion is insufficient to account for the degree of haemo-concentration as manifested by a rise in total solids, haemoglobin, and plasma proteins

biliousness which will be very useful to those who are confronted almost daily by this complaint in practice Skin subjects in this volume include blastomycosis, baker's itch barber's rash, boils and carbuncles, and a very practical article on bedsores Asthma, bronchitis and bronchiectasis are fully dealt with and articles on aviation and caisson disease will interest and instruct members of the profession in the special services Dr Adolphe Abrahams takes a broad minded survey of the relation of athletics to practical medicine and athletic injuries of the limbs are reviewed by Mr W E Tucker The management of squeezing and rupture of internal organs like spleen and kidney is not mentioned, though these are not rare in the more strenuous games

RADIODIAGNOSTICS

Recent Advances in Radiology By Peter Kerley M D B Ch D M R E Second edition (Pp 322 176 figures 10s net) London J and A Churchill 1936

Dr Peter Kerley's small handbook deals exclusively with radiodiagnostics no space is given to important advances in technique, some of which would be of great use to the radiologist The chapter on x-ray therapy which appeared in the first edition has wisely been omitted and we look forward to a special volume devoted to a branch of radiology in which the recent advances are so numerous that they can only be adequately surveyed in a series such as this

The opening chapters are concerned with injuries and diseases of bones and joints and with deformities and diseases of the skull These subjects are somewhat perfunctorily handled thus there are only a few lines on epiphyses which will be of little use to the student who is reading with a view to a diploma in radiology A bibliography however at the end of each chapter will help the student in his search for further information A large part of the book deals with the chest and includes diseases of the heart aorta mediastinum lungs, pleura and the diaphragm This is in every way excellent and will prove a valuable guide to the interpretation of x ray films It gives an adequate outline of the present position of our knowledge of the various diseases associated with signs and symptoms in the chest The remaining chapters deal with the alimentary canal biliary tract, and the genito urinary tract They present in a very concise form the essential radiographic features of the normal and abnormal conditions met with, and once again a useful bibliography will direct the student to other sources of information

The illustrations are numerous and of excellent quality throughout There is a good index and the book can be recommended to those who want to get a general idea of the value of x rays in diagnosis

MICROSCOPES AND MICROSCOPY

The Microscope By Simon Henry Gage Sixteenth edition revised and enlarged by the addition of a chapter on Micro Incineration (Pp 617 313 figures 4 dollars) Ithaca New York Comstock Publishing Co 1936

The book by Dr S H Gage emeritus professor of histology and embryology at Cornell University, has now attained its sixteenth edition This fact alone testifies to its worth for it is inconceivable that a textbook which was not fulfilling its purpose and really well at that should have run through so many editions And on reading it the reason for success soon becomes evident it is the author's gift of simple and clear exposition Starting with a chapter on microscopes and their parts in which the complexities of the modern microscope are approached through a consideration of magnification obtained by hand lenses and microscopes of primitive construction the author proceeds to discuss the various forms of microscopy In succeeding chapters the use of the microscope with visible light—bright field microscopy and dry ground microscopy—the polarizing microscope the microspectroscope and the adaptation of the microscope to use with ultra violet light are described Next comes a valuable chapter on the interpretation of appearances in which is stressed the need for caution and the desirability of submitting material to as many forms of microscopical examination as possible before drawing conclusions The author is at pains to point out that one should not be satisfied with a mere examination of fixed and stained preparations Much is to be learned from a study of material in the fresh state both with transmitted white light and dark ground illumination and though this is a point of view to which everyone would subscribe it is unfortunately often ignored in practice

Other subjects covered in this book are the making of drawings of microscopical preparations and micro projection photomicrography, the reagents used in histological work, and all the technicalities entailed in the making mounting and storing of specimens There is also a chapter on micro incineration that recent addition to the histologist's armamentarium The book contains numerous illustrations, mostly line drawings and possesses an adequate index

MENTAL TESTING

A Guide to Mental Testing For Psychological Clinics Schools and Industrial Psychologists By Raymond B Cattell M A B Sc Ph D (Pp 312 64 figures 10s 6d net) London University of London Press 1936

The subject of mental testing is now much to the fore and the literature devoted to it is both voluminous and widely distributed Dr Cattell has endeavoured to provide sufficient instructions test materials and norms to aid the experimenter in assessing the principal aspects of personality so far made accessible to direct examination In this he has undoubtedly succeeded As a work of reference his book should prove invaluable All the principal tests in common use are listed together with the materials required the publisher's name and where possible, norms for English subjects As is usual in such a compilation some errors have crept into the list of tests Thus the 1919 revision of Porteous's maze test is listed instead of the improved 1933 revision and the Kent Shakow formboards are not specifically stated to be formboard tests while the industrial model is referred to as the complex instead of by its proper name These are but small drawbacks to a most valuable list

As a clinical manual the work is less satisfactory and the psychiatrist or certifying officer seeking an introduction to the thorny subject of psychometrics from a clinical point of view will find the book's usefulness limited by its author's unswerving loyalty to the tenets of the factorial school of Spearman both in his recommendation of tests and in his discussion of the psychological basis of testing The statistical psychologist is interested primarily in the trait rather than in the patient in mathematical validity rather than in clinical usefulness an attitude which is justifiable in the laboratory but not in the consulting room This is especially seen in the emotional field where the clinician is particularly at home the statistician particularly at sea Dr Cattell as a good statistician condemns for example the Rorshach test

ago It was now agreed, on the motion of Sir Crisp English, that the committee should consist of those members of the previous committee who were also members of Council, with power to co opt two outside persons A suggestion from the Federation of Societies of Teachers in Physical Education that a joint standing committee should be set up consisting of members of the British Medical Association and of the physical education profession was referred to the new committee A resolution from a meeting called by the Medical Peace Campaign asking the Council to consider instituting an inquiry similar to the nutrition inquiry, into the value of anti chemical warfare measures was received It was decided to ask the Science Committee to consider the practicability of undertaking what was suggested

Regional Medical Secretary for London

On the recommendation of the Appointments Committee the Council agreed to the appointment of Dr A Keith Gibson as Regional Medical Secretary for the London area the office to begin as from April 1 next Dr Gibson was honorary secretary of the Kensington Division from 1929 to 1932 its representative on the Representative Body for four years, a recent member of the Medico-Political Committee, and has been a member for eight years of the London Panel Committee and the council of the London Public Medical Service In welcoming Dr Gibson the Chairman pointed out that the new office was in the nature of an experiment on the part of the Council, and on its success or otherwise future policy in this respect would depend

National Health Insurance

Dr Dain who introduced the report of the Insurance Acts Committee in the absence of Dr Jonas, stated that a special subcommittee was now engaged in preparing the case for an increase in the capitation fee He also reported to the Council the decisions of the Panel Conference of January 7th unanimously rejecting the Minister's offer of a capitation fee of 7s 6d for the new class of insured persons under 16 years of age, recommending insurance practitioners to decline service at the terms offered and declaring that it was not prepared to accept for attendance on insured workers under 16 a capitation fee less than that paid for adult insured The report was approved by the Council

The Chairman stated that the New Zealand Branch Council in view of the intention of the Government there to introduce this year a national health insurance scheme, had asked if it was possible to secure the services in an advisory capacity of Sir Henry Brackenbury, whose help in influencing the Government on behalf of the profession would it was felt be extremely valuable Sir Henry Brackenbury had expressed his willingness to serve the [illegible] Council and the Association in the way suggested, [illegible] well known in New Zealand and has given [illegible] attention to the Branch there On the [illegible] proposition the Council unanimously asked [illegible] Brackenbury to act as the Association's repre- [illegible] agreed that arrangements be made for him [illegible] more direction via North America which would [illegible] opportunity for renewing the contacts made [illegible] the Association tour in 1935

Contract Practice Arrangements

Dr Bone on behalf of the Medico-Political Committee, proposed that certain recommendations be made to the Representative Body with regard to the principles which should govern contract practice arrangements The first two recommendations—namely, that it is desirable in all contract practice arrangements that the content of medical service to be provided should be that laid down by the Association in its Public Medical Service Scheme, and that wherever practicable private clubs should be replaced by Public Medical Services—were agreed to without discussion Dr Fothergill raised the question as to the relevance of the words "wherever practicable," and asked whether there were any circumstances in which private clubs should not be so replaced, to which Dr Bone replied that nothing was impossible, but he did not think it was a practicable arrangement in a country village to set up a Public Medical Service, and there might be other special areas where it would be more practicable for private clubs to continue

To the third recommendation—namely, that if and when practicable works and colliery contract arrangements should be replaced by an organization such as a Public Medical Service—some opposition was expressed Dr J B Miller moved that this recommendation be deleted For a hundred years contract appointments had provided medical attendance for miners and their dependants, in general to their satisfaction On the other hand, the Public Medical Service was of recent growth and would have a short life, as it was bound to disappear when an extension of national health insurance to cover dependants came about In the colliery arrangements deductions from wages were compulsory, in the Public Medical Service they were voluntary The expense of running a Public Medical Service would be from four to six times that of running a colliery appointment All colliery arrangements in Scotland were run by a joint committee of miners representatives and doctors Disputes on small points were settled by a joint body He agreed that in certain districts colliery fees were not what they should be, but in the whole of Scotland, in the greater part of Wales, and in general in Northumberland and Durham the rates were satisfactory the opposite was the case only in small areas in the Midlands

Dr Pooler agreed that over the greater part of the country colliery contract practice was in a fairly satisfactory position But there were districts, particularly in the North Midlands and in South Yorkshire, where remuneration was not what it should be No doubt it was true to suggest that that could be remedied by concerted action But what kind of concerted action? He spoke as a former Divisional secretary who had had to bear the heat and burden of the day in contests with miners organizations To his mind the Public Medical Service was the better form of contract practice He would not advocate any precipitate action to implement the recommendation but as a colliery practitioner and as a man who had been through fight after fight—though the fights had not been unsuccessful—he felt that there could be no possible harm in a recomemndation such as this, and that there might be a great deal of good

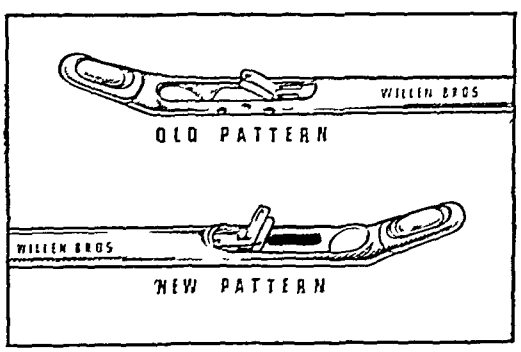
Dr Thomas supported the amendment for deletion There was no difficulty in colliery practice in Wales He had been engaged for fifty years in such practice, and had never had a fight at all He would not say that it was impracticable in any area to replace the arrangements by a Public Medical Service, but it was not advisable

Dr Wand said that examples of the dangers that might arise from works contract practice arrangements would be fresh in the minds of the Council A great value attached to the strength of the Public Medical Service on the matter of the capitation fee The future of contract practice under the Government, which was bound to come, would depend entirely in respect to the size of the remuneration upon the solidity of the Public Medical Service movement

Dr Bone read out some of the rates obtaining in South Yorkshire These varied greatly, but in many cases were below what they ought to be

The proposal to delete the recommendation was lost, and the recommendation was agreed to, as was a further one that in the case of adult and juvenile members of friendly societies the arrangements for medical service provided by these societies should be through a Public Medical Service or similarly constituted organization

It was also agreed to recommend that there should be no differentiation in the contract rates for medical attend-



Hopes raised in anticipation were sadly deferred after reading *Cytologie de Liquide Cephalo Rachidien* by H JESSEN (Paris Masson et Cie, 40 fr) It is a critical review of our ignorance of a subject about which practically nothing is known Some estimate of the author's labour may be judged from nearly twenty pages of bibliography including references to those who have devised methods for exhibiting the cells for differentiating them and for enumerating them efforts mostly mistaken and barren of reliable results Attempts to arrive at some normal standard for the maximum and minimum limits are all unsatisfactory and open to suspicion since normal people can rarely submit to spinal puncture for the withdrawal of fluid In conclusion the author finds definitely that cells of lymphoid character are present in the cerebrospinal fluid of *presumably* healthy human beings, but their origin and relation to the cells of other tissues must remain uncertain and above all their numbers are very few He suggests that 0 to 5 per c mm should be regarded as *normal 5 to 10 per c mm as doubtfully normal* or even pathological, and that over 10 per c mm is definitely pathological Surely this rough classification can have but slight practical value especially as the enumerations are always qualified by the presence of degenerated cells and cellular debris Apart, however from his depressing results Dr Jessen has contrived to introduce a continuous interest into his subject, which from its very elusiveness should not fail to stimulate further research, and the monograph will be invaluable to all future workers

Preparations and Appliances

IMPROVED IRRIGATING CYSTOSCOPE

Mr H P WINSBURY WHITE FRCS (London W1) writes

I have now used for a good many years the cystoscope which was originally made for me by the Genito Urinary Manufacturing Company Ltd To supply an efficient inflow of fluid into the bladder without unduly increasing the calibre of the instrument the inflow is arranged between an inner and an outer sheath The fluid in the former model escaped from the instrument into the bladder through a number of

small aperture near the vesical end both on the outer and inner aspects of the sheath Although it has always proved an excellent instrument for use in the electro coagulation of bladder growths it suffered from the defect that a strong current would cause bubbles to settle over the telescope window and to obscure the view This fault has now been remedied by replacing the numerous small holes in the outer sheath by a single elongated inflow orifice This lies horizontally on the left lateral wall of the interior aspect of the sheath adjacent to the window of the telescope and measures 10 mm by 2 mm The improvement in the usefulness of the cystoscope as a result of this modification is considerable The alteration was made for me by Messrs Willen Bros., 55, New Cavendish Street London W1

OPHTHALMIC TREPHINE SCISSORS

Mr J EDWARD MARTIN (Clifton) writes I designed these scissors to facilitate the dissection of the flap before trephining and I find them very comfortable in manipulation The instrument has been made for me by Messrs John Weiss and Son The object of the design is to diminish flexion of the operator's wrist and thus avoid impairment of the finer movements of

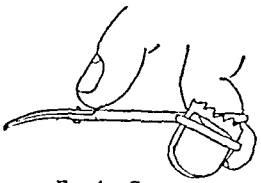


FIG 1—Cutting

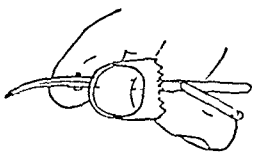

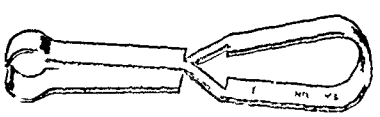

FIG 2—Blunt dissecting

the hand The details are—length 3½ inches blades curved on flat with mean radius of curvature of 1 inch points fine sharp slightly ground off joint screw bow for thumb angled at 20 degrees from the straight as shown in Fig 1 A transverse section of the joint or shanks (when closed) would be quadrilateral the flat sides assisting the grip in blunt dissection as shown in Fig 2

CIRCUMCISION CLAMP

Mr J S ROWLANDS (Rhyl) writes

There is no doubt that the time honoured much discussed and much abused operation of circumcision can be inartistically done In a large measure this is due to the instability and the smallness of the organ operated on rendering the estimation of the necessary flaps difficult In order to obviate some of these difficulties Messrs Allen and Hanburys of *Wigmore Street have kindly made to my design a circum*

cision clamp as illustrated This is applied to the mid portion of the body of the penis and is held by the anæsthetist By means of this clamp the small penis is held firm and in a position more easily dealt with Haemorrhage is practically *nil* sutures are more delicately inserted owing to the resistance of the clamp and lastly slight pressure is brought to bear on the urethra, thus removing a good deal of uneasiness and expectancy on the part of the operator I hope that this instrument will help the general practitioner in this particular type of operation

TO REMOVE PLASTER STRAPPING

Antihaesin is a non irritant non inflammable solution for the painless removal of plaster strapping It destroys the adhesive properties of the strapping and enables it to be removed smoothly and evenly The advantages of avoiding pain and shock especially to patients weakened by illness or prolonged incapacitation are obvious For this reason alone antihaesin should be of great interest to surgeons dressers and nurses It may be obtained in 4 oz and 20 oz bottles from the makers, Allen and Hanburys Ltd Bethnal Green London E 2

VERPINE DISINFECTANT

Verpine (C G Fox and Co Ltd) is an antiseptic and disinfectant fluid which contains aromatic terpenes ($C_{10}H_{16}$) and chloroxylenol (2-chloro 5 hydroxy *m* xylene) mixed with a neutral solution of soap to render them soluble in water The solution has a phenol coefficient of 3 It can be used undiluted on the hands and a 5 to 10 per cent solution is recommended for use on mucosae and wounds

The other matter concerned cases in which practitioners have accepted appointments as whole-time medical officers at salaries in accordance with the Askwith memorandum, but the local authorities concerned had been non-assenting bodies and were not applying the scale in regard to other members of their staff Professor Picken said that there was a feeling among men in the public health service that the Association was not acting as firmly in these cases as the occasion required In fairness to the Society of Medical Officers of Health, which was taking a strong line in this respect and to local authorities which were abiding fully by the terms of the memorandum, these cases should not be passed over

It was agreed that the matter should be further considered by the Ethical Committee

Co-operation with the Trades Union Congress

A letter from Sir Walter Citrine, secretary of the Trades Union Congress, was placed before the Council in which he said that the general council of his body had had under consideration for some time the possibility of a closer working link between the trade union movement and the medical profession He suggested a standing joint committee to deal with the subjects on which co-operation would be desirable, including possible differences on local medical schemes In an interview with representatives of the Association Sir Walter Citrine stated that his council had come to the conclusion that the British Medical Association was the organization most widely representative of all sections of the profession, and was recognized as such by the Government departments and other negotiating bodies

The Chairman of Council said that this was a most significant and important matter The Trades Union Congress Council evidently appreciated the value of co operation with the Association in discussing broad questions of health policy as affecting their constituents The suggestion was made that there should be a small committee, one half of which would be appointed by the Association and the other half by the trade union side, to meet alternately at the B M A House and the trade union headquarters with chairmen drawn alternately from either side

The Council approved the setting up of such a committee The members chosen to represent the Association were the Chairman of Council, Sir Henry Brackenbury, Dr Dain, Dr Bone, Professor Picken, Dr Pooler and Dr Anderson (Medical Secretary) The Chairman of Council said that a debt of gratitude was owing to the Deputy Medical Secretary (Dr Hill) for the energetic labours which had been largely effective in bringing about this co-operation

Medical Charities

Dr Henry Robinson chairman of the Charities Committee brought forward a recommendation that the amount standing to the credit of the Charities Trust Fund be distributed as to £562 to the Royal Medical Benevolent Fund and as to £281 to Epsom College, and this was agreed to Dr Robinson also mentioned a matter which had been considered at some length by the committee Dr Andrew McCarthy of Birmingham had put forward a request and reinforced it by discussion with the committee that there should be set up by the Charities Committee a foundation scholarship for the sons of deceased [illegible] Catholic medical practitioners tenable at a Roman [illegible] comparable with Epsom College Neither [illegible] Benevolent Fund nor Epsom College [illegible] religious discrimination and sons of Roman Catholic parents had frequently been admitted, both as foundationers and as paying pupils to Epsom College This however did not satisfy Dr McCarthy, who pointed out that in the event of foundation scholarships for sons of Roman Catholic parents not being set up by one of the existing medical charities it was probable that they would be set up by Roman Catholic doctors themselves, with a resulting diminution in the subscriptions of such doctors to other medical charities

The Charities Committee while appreciating Dr McCarthy's point of view, as well as the courtesy combined with firmness with which it was argued, was of opinion that if discrimination were made in favour of one Church other denominations would put forward similar requests

The Council agreed with the committee's view that, however commendable Dr McCarthy's scheme might be, it was undesirable that the Association should take any action in the matter

Organization

The principal matter on the Organization Committee's report, introduced by Dr Matthews, was a recommendation that the subscription of those who had been members of the Association for fifty or more years should be reduced to one guinea It was stated that there were 189 such members Dr Dain expressed the view that it would be a more gracious and kindly act in the case of these very old members to forgo the subscription altogether If, as they were told, some of them had difficulty in affording two guineas, they would not have much less difficulty in affording one and it did not seem to him to meet the situation to split the subscription in half

After some further discussion Dr Matthews undertook that his committee should consider the question further

The other recommendations of the committee related to changes in the articles and by-laws consequent upon recent decisions as to membership The Chairman of Council was authorized to forward suitable letters to Dr S Vatcher, who had recently relinquished the honorary secretaryship of the Barnet Division, and to Dr A A McWhan lately honorary secretary of the South-Eastern Counties Division, whose services were considered by the Council to be deserving of special recognition Dr Matthews stated that the Organization Committee had placed on record its appreciation of the very valuable services of Dr Arnold Lyndon as chairman of the Grants Subcommittee for the past eleven years

"British Medical Journal"

After dealing with certain routine matters which arose on the report of the Journal Committee and of the Board of Directors, Dr Gordon, chairman of the committee and of the board, said that the reception of the *Journal* in its new form had been most favourable, and the Editor had received a large number of congratulatory letters

The Chairman of Council said that he thought the Council would like him to express on its behalf its great appreciation of the new *Journal* and of the hard work and forethought it had entailed especially upon the Chairman of the Committee the Editor, and the Deputy Editor The improvement was so outstanding that it seemed to him to be the occasion for more than a casual expression of satisfaction, and that the Council's feeling on the subject ought to be in the form of a minute in its proceedings He moved accordingly, and this was agreed to with applause

Dr Gordon reminded the Council of the hard work of some others behind the scenes, especially Mr F A Turner, head printer on the literary side

Other Business

A conference had been held with the honorary local general secretaries of the five most recent Annual Meetings and the forthcoming meeting at Belfast to consider in particular the suggested appointment of a permanent secretary for the Annual Meetings of the Association The difficulty lies in the local character of the meeting, and no definite decision was reached on the question, but some advice was tendered to the Plymouth executive committee, which is responsible for the arrangements for the meeting of 1938

(as trustees) Other parts of the testamentary phraseology bear a certain likeness to the language employed by the Medical Research Council in the pamphlet describing its own constitution and functions The medical trustees whom the will named were persons who, in one capacity or another were concerned in the work of that body, and therefore likely to be in sympathy with the testator's ambitious projects At the time the will was made (February, 1932) Sir Walter Fletcher was secretary of the Medical Research Council, Sir Henry Dale has long been closely associated with its work, and Professor Elliott was formerly a member and known to Sir Henry Wellcome in that capacity Of the other trustees two are solicitors and one a chartered accountant The number of trustees will always be five and express provision is made in the will that two shall be men of medical eminence, two shall be men of business and administrative experience at least one of them of high standing and ability in the law and that all shall be persons in sympathy with the work of the Foundation

The trustees are given very wide powers While no doubt one of their cares will be to provide for researches to be carried on in the existing Wellcome institutions they are by no means limited to these They can use money for the support of research work in a much larger field of inquiry no matter where it may be carried on and without reference to nationality or race They can subsidize at their discretion virtually any form of medical research Their aim, to quote the words of the will, is to be "the advancement of research work bearing upon medicine, surgery, chemistry physiology, bacteriology therapeutics, materia medica, pharmacy and allied subjects, and any subject or subjects which have or at any time may develop an importance from the invention and improvements of medicinal agents and methods for the prevention and cure of diseases and control or extermination of insect or other pests" Grants can be made either to individuals or to institutions Any form of research can be subsidized independently of the laboratory in which it is undertaken Commissions of investigation can be set up Provision may be made for the publication of the results of research Special research expeditions—one of Sir Henry Wellcome's particular interests—may be fitted out The furnishing and equipment of museums, libraries research bureaux, and laboratories may be provided Perhaps it is well to add—to prevent the trustees from being overwhelmed by appeals for all manner of researches deserving or not—that for the next year or two there will be unknown demands on the realized profits of the Foundation There may well be supplemental sums to be found for death duties, and there will have to be preferential provision for the personal bequests named in the will But eventually there can be no reasonable doubt that a very large sum will be available annually for the widest purposes of research which is likely to conduce to the improvement of the physical condition of mankind

Attention is drawn in the letter which appears elsewhere to a proviso on which the medical trustees have insisted A clause in the will calls upon the trustees to enter into a covenant not to be engaged in or in any way to assist any concern carrying on business in competition with the Wellcome Foundation A form of words has been added to the covenant by order of the High Court whereby any implication incompatible with the position of the trustees as members of the medical profession and independent men of science has been removed the other three trustees, who were not affected, cooperating in these proceedings The order not only meets the case of the present two medical and scientific trustees but empowers any such trustees appointed in future to add this proviso to their covenant In taking this action Sir Henry Dale and Professor Elliott have evidently intended to make it plain that their acceptance of trusteeship is on conditions which place its scientific independence beyond question The trust has every appearance of being a big undertaking perhaps bigger in the next generation than it can be in this Upon the trustees, especially those representing medicine and the ancillary sciences, a great responsibility will rest for the worthy investment of the sums which periodically become available Even the trustees themselves cannot as yet see clearly "the shape of things to come" The acceptance of the trust could only be regarded as a public duty—a duty not only to the past, to carry out the wishes of a testator of philanthropic vision but also to the future to the various work with unimagined possibilities which may be started as a result of this inheritance In undertaking the duty which will not be an easy one the medical trustees will enjoy the confidence of all their scientific colleagues and may add another noteworthy chapter to their own eminent services to medicine

BIOLOGY IN EDUCATION

The plea for the study of biology as an essential part of a liberal education has been made now for many years, and it grows in cogency from year to year At recent educational conferences it has been reinforced very powerfully by Professor J S B Stopford's address to the Association of Science Masters at the University of Manchester and by

THE INFLUENCE OF THE ASSOCIATION ON LEGISLATION

(*Concluded from page 43*)

PART II

Legislation concerning medical services provided under authority of Act of Parliament has naturally demanded a large proportion of the British Medical Association's attention, and the Association may fairly claim a large share in the creation or development of several branches of the public health medical service The school medical service, for example, was the direct outcome of much preliminary work performed by it from 1888 onwards through its Committee on the Physical and Mental Condition of Children in Elementary Schools and through extensive investigations in collaboration with other bodies Certain local school boards adopted limited schemes of medical inspection as a result of this pioneer work and an official recognition of the principle of inspection was contained in the recommendation of an Interdepartmental Committee in 1904 that inspection of elementary school children should be carried out systematically The recommendation was very inadequate, but the Association's persistent memoranda and deputations urging the Government to take a broader view of its responsibility were eventually rewarded by the insertion in the Education (Administrative Provisions) Act of 1907 of a clause which made provision for the medical inspection of elementary school children obligatory,, and permitted arrangements for 'attending to their health and physique' By the time of the passing of the Education Act of 1918, which required local authorities to provide treatment as well as inspection and extended the principle of inspection to other educational institutions the Association's long insistence on the inclusion of the general practitioner in the system had borne fruit for the Act included a section prohibiting education authorities from establishing a general domiciliary service of treatment for school children and young persons and requiring them to consider how they could utilize the services of private medical practitioners

Maternity and Child Welfare

In the sphere of maternity and child welfare the influence of the Association is more visible in administration than in legislation but so far as the provision of midwives is concerned it has exerted a very powerful influence Between 1873 and 1902, when the first Midwives Act was passed the subject of the education and control of midwives was constantly before the Association several Bills were drafted but all failed for various reasons to reach the Statute Book The 1883 Bill, for example was actually adopted as a Government measure, but it had to be dropped owing to the pressure of Parliamentary business the 1890 Bill was withdrawn owing to the opposition of the medical profession itself, which believed that the proposals for control were inadequate In 1902 the Government introduced a Bill which, although the *British Medical Journal* characterized it in its original form as the worst of the whole series, gave the Association the opportunity in the year of its reorganization of demonstrating its strength both inside and outside Parliament for by the time the Bill became law it had been transformed largely by the Association's efforts, into a measure embodying to a great extent the Association's own policy The Act, however was not perfect and it was not until 1918 that a new Act removed some of its defects and included a provision to which the Association had always attached great importance—namely, the payment by local authorities of a fee to medical practitioners called in by midwives

Co-ordination of Medical Services

In general, the Association's policy relating to the provision of medical services by the central and the local governments has been in advance of public opinion, and as early as 1870 it expressed the view that such services should be co ordinated under the guidance of one Government Department While advocating or assisting in the development of particular services it has always been guided by its opinion that they should be regarded as parts of a co-ordinated whole, and as contributions towards a general medical service for the nation The creation of the Ministry of Health in 1919 and the passing of the Local Government Act in 1929 represented a considerable measure of official and legislative recognition of the Association's policy of co ordination The Local Government Act also facilitated the fulfilment of two other principles which the Association had advocated for a number of years By transferring the functions of the boards of guardians to the local government authorities it assisted in the abolition of the distinction between the destitute and the other classes of the community so far as medical attendance and treatment are concerned, and in the development of a unified local hospital system in which the right to treatment is based solely upon medical need and not upon the patient's financial means or lack of means

Road Traffic Act

Evidence of the frequent difficulty of securing legislation, even when there is obvious need for it is contained in the record of the Association's efforts to remedy the formerly well-founded grievance of medical practitioners that they were unable to obtain the payment of fees for first-aid treatment rendered by them to persons injured in road accidents Discussions between the Association and insurance companies on a proposal for a central pool for the purpose of providing doctors' fees were unsuccessful, and the Association therefore concentrated its efforts on securing some statutory provision The late Lord Moynihan presented the profession's views to the House of Lords during a debate on the Road Traffic (Compensation for Accidents) Bill in 1933, and his statements were reinforced by the Association's evidence to the Select Committee appointed to consider the Bill Lord Moynihan himself on a later occasion introduced a Bill specifically providing for the payment of fees for emergency treatment but both these Bills were eventually dropped It had become clear, however during the progress of Lord Moynihan's Bill that the Government was unwilling to give immediate support to a proposal which might entail a new injustice to other persons The Association thereupon approached the Board of Trade, which was understood to be reviewing the whole question of road accidents and the final result of these negotiations was the inclusion in the Road Traffic Act of 1934 of a detailed statutory procedure enabling doctors' to obtain a fee for any emergency treatment given by them in road accident cases

Mental Treatment Act

The Association's endeavours to protect medical practitioners so far as possible from the legal risks incurred by them in the course of their work may be illustrated by the Mental Treatment Act of 1930 The inadequacy of the protection afforded by the Lunacy Act of 1890 had on several occasions been demonstrated by disturbing

has drawn attention to cases of this disease in which the antidiuretic hormone was not effective when certain cellular elements in the hypothalamus were destroyed These elements were not those which are supposed to control the formation of the antidiuretic hormone Two possibilities present themselves Either the antidiuretic hormone produces its effect through a nervous pathway to the kidney which begins in the hypothalamic nerve cells or the hormone reaches the hypothalamus in an inactive form and is activated in these nerve cells The former theory is unlikely as the antidiuretic hormone can act on a kidney deprived of its nerve supply The second assumes that certain nerve cells of the hypothalamus have a function different from that of ordinary nerve cells and are not far removed from secretory cells The histological appearances of these cells tend to support this hypothesis The interest of this work lies in the suggestion that the brain may be more than a nervous mechanism and that it may contain in a certain region cells which have an "endocrine" function

THE TRAFFIC IN NARCOTIC DRUGS

There is a prospect that this year may see some progress made with the limitation of production of raw opium in accordance with resolutions passed both by the Council and the Assembly of the League of Nations The Advisory Committee on Opium and Other Dangerous Drugs is collecting information in reply to a circular issued to all Governments with a view to summoning two preliminary conferences as soon as these can be arranged One of these will be composed of representatives of countries which produce raw opium for export and the other of representatives of countries which export opium "prepared" for smoking or which have monopolies for prepared opium It is estimated that an average of 240 tons of raw opium are required annually for the legitimate manufacture of drugs and some 300 tons are deemed to be required annually for making "prepared" opium for smoking As against this 540 tons there is reason to believe that the annual world production of raw opium amounts to between 1 000 and 1 500 tons The largest producer of the opium poppy is China, the other opium growing countries are Afghanistan Bulgaria Greece, India Iran, Japan Korea Turkey Soviet Russia, and Yugoslavia As regards narcotic drugs the Supervisory Body set up by the Limitation Conference of 1931 has estimated the legitimate world requirements for the current year as follows morphine (including that used for "conversion" into other drugs) 40 976 kg heroin 965 kg codeine 25 724 kg dionine 3,199 kg and cocaine 4,976 kg These estimates of requirements are for all countries and territories of the world In the case of sixty one countries the figures were furnished by those countries and passed by the Supervisory Body In the case of nine countries from which no estimates were received these were made by the Supervisory Body Four of the nine were parties to the Limitation Convention—namely Spain Ecuador Haiti and Peru The remaining five were Argentine Bolivia Ethiopia Liberia and Paraguay The number of countries furnishing the necessary estimates has risen from forty-five in 1933 to sixty one in 1936 While the illicit trade in narcotics continues to be distressingly large seizures of contraband are said to be fewer and of less amount except in the case of cocaine and Indian hemp It is believed that addicts unable to obtain morphine and heroin are using cocaine and Indian hemp in substitution The Permanent Central Opium Board has drawn attention to the high rate of consumption of opium in Scandinavian countries in Iceland the rate per million inhabitants reached 191 30 kg in 1935 The exceptionally high rate in India 697 04 kg in 1934 per million inhabitants, is attributed to the opium eating practised in that country

THE BLOCKED PULMONARY CAVITY

Two recent papers[1] - by Salkin Cadden and McIndoe advance our knowledge in regard to the pathology and clinical picture of tuberculous lung cavities The authors carried out post-mortem bronchography in seventy cases, consisting of the injection soon after death of a solution of potassium iodide, barium sulphate and milk the dead person being seated in a specially constructed chair the back of which forms the casette holder (Various other important points in the technique are described in the articles) In thirty seven of these cases a necropsy was performed and the investigation was completed by a clinical study of living patients The authors were able to show that pulmonary cavities may exist without communication with the tracheo bronchial tree (in 14 per cent in their series) and that these may be of any size and with or without a fluid level While thus "blocked" they may still give the physical signs of a cavity and even enlarge they present the same gross and microscopical characters as cavities which do communicate with the bronchial tree The blocking of the cavity may be due to extrabronchial fibrosis to occlusion of the bronchial lumen by inflammation or by purulent plugs or to filling up of the cavity with caseous debris Thus blocking of the draining bronchus of a cavity does not cause its healing or the disappearance of the appropriate physical signs nor does failure of lipiodol to enter a cavity mean that no cavity is present The healing of a cavity is not a simple anatomical process it depends on the structure of its walls and that of the surrounding pulmonary tissue The authors conclude that the prognosis of blocked cavities does not appear to differ from that of the open variety and that collapse therapy should be given a trial except for those which filled with caseous debris become clinically inactive after inspissation and encapsulation Salkin Cadden and McIndoe also found that only a small number of all cavities had dependent drainage most efferent bronchi arose from the upper parts of the cavity wall they therefore stress the importance of change of position and the need of postural drainage in order to place the draining bronchus in a dependent site particularly for cavities showing a fluid level Among other important points brought out by the authors by means of their technique are the following The ease with which

[1] *Amer Rev Tuberc* 1936 34 634
[2] Ibid 1936 34 649

accident or death, the person or persons to whose negligence or fault the accident is attributable, and the precautions, if any, by which it might have been avoided It is of the utmost importance that doctors should realize that the verdict of the jury may attach responsibility for the death to the practitioner who has been in attendance In all cases where the circumstances give rise to a reasonable chance of responsibility for the death being attributed to the doctor he will be notified by the procurator-fiscal of the intention to hold an inquiry Any doctor receiving such notification should at once take steps to be legally represented No notification of the intention to hold a post-mortem examination is given, but if the doctor concerned should have reason to believe that one may be held he should at once apply to the procurator-fiscal for permission to be represented

PUBLIC HEALTH NOTES

Diphtheria Immunization

The earlier preparations used to produce immunity against diphtheria were toxin-antitoxin mixtures possessing a slight excess of toxin, this surplus being considered to be the effective agent When it was found that the toxin-antitoxin mixture became dissociated in the tissues neutral mixtures were employed Because of the tissue reaction to the toxin it proved necessary in order to introduce sufficient antigen into the body to give repeated doses of the toxin In an attempt to overcome this disadvantage T A F was devised this being a toxin-antitoxin compound in solid form the floccules produced by the combination of toxin antitoxin mixtures, after washing being suspended in physiological saline Although this preparation had no undesirable reactions it was found that in the case of children the requisite degree of immunity did not follow on the single injection and repeated doses were necessary Owing to the slow rate of absorption of T A F the optimum spacing of doses is longer than in the case of other preparations Anatoxin or formol toxoid is a preparation in which the toxicity is removed by treating the mixture with formalin While atoxic, its use, nevertheless, is sometimes followed by local reactions so that divided doses of this preparation, too are necessary Further efforts were made with the object of producing a depot effect by which the release of antigen into the system would be more gradual These resulted in the preparation of alum precipitated toxoid, in which flocculation was obtained by aluminium salts

The ideals of a prophylactic are that it shall be harmless [illegible] local or general reaction and be efficient [illegible] immunity which is reasonably lasting [illegible] few injections the better and it is desirable [illegible] local effects should follow as rapidly as [illegible] body response to an antigen of this [illegible] to a certain degree on the existing state [illegible] and on the extent of previous exposure to infection [illegible] preparation is likely to be the best for use [illegible] circumstances the antigen most advantageous [illegible] be case of young children in a rural community is not the antigen of choice for an adult brought up in urban surroundings Ease of administration which in this particular case is judged more by the fewness of injections than by freedom from reactions, must be a very powerful factor in deciding which material to use and in this regard the "one-shot" preparations offer a very real attraction It has been submitted that it is preferable to get a very large number of children treated by a preparation of relatively low efficiency rather than a much smaller number of children by any more efficient preparation Undoubtedly many more children would undergo inoculation if they were subjected to one injection only Probably there would be little enough gained by using preparations necessitating two as compared with three injections, but many more parents would bring their children if only one attendance was entailed If the results from the use of the "one shot" preparations were anything comparable to those of the more established agents then use would rightly become general But it cannot be said that this is the position, at least as regards some preparations and there is no way in which the efficient can be distinguished from the inefficient

Dr Guy Bousfield writing from his extensive experience as medical officer to a number of immunization clinics in and about London pleads in a recent issue of the *Medical Officer* for the immediate abandonment or control of "one-shot" treatment He points out that while some preparations of A P T are successful in 80 per cent of cases others have an efficiency as low as 37 per cent and that at present there is no guide to users as to the efficacy of any individual preparation As a remedy he suggests some amendment of the Therapeutic Substances Act which would secure that preparations ostensibly similar should be comparable in efficiency Apart from this aspect however, he deplores the fact that such preparations are used which at their best give 80 per cent of successes when there are known methods by which much nearer 100 per cent of successes can be obtained

Little guidance has been received from the Ministry of Health, its only publication being Memo 170/Med issued in 1932, which quoted findings of the conference that followed an investigation into active immunization against diphtheria carried out under the auspices of the Health Organization of the League of Nations Formol toxoid the use of which necessitates carrying out the Moloney test was the only prophylactic mentioned, it being suggested that this should be given on three occasions at fortnightly intervals Since then much work has been done in this country on immunizing children against diphtheria, different reagents being used with different time spacings and varying doses and among different sections of the community There has been little correlation of the information, however, extensive publication of the results observed in various districts being left to the manufacturers of the products used One large investigation carried out by Dr Guy Bousfield and Dr E H T Nash showed that three injections of T A M produced an immunity which was effective in 93 per cent of children at an average of 3 6 years after immunization Until investigations carried out on a comparable scale with other preparations show that similar results can be obtained, it would seem that T A M or something like it, should be the preparation of choice

Public Health Medical Service

The following changes have recently been made in the public health medical service staffs

Dr W J F Davies to be assistant medical officer at the Exminster Hospital under the Devonshire County Council

Dr Sarah B Harris to be deputy medical officer of health for Maidstone

Dr R C Holderness to be medical officer of health for Loughborough

Dr H G Hutton to be assistant school medical officer for Leeds

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

PHYSIOLOGY OF THE ADRENAL GLAND

BY

S LEVY SIMPSON, M A, M D, M R C P

The adrenal glands consist of two components an outer cortex and an inner medulla, the former being derived from the mesoblastic urogenital ridge and the latter from the neural ectoderm in common with the sympathetic neurones The main nerve supply is from the splanchnics, and the neural impulse is transmitted (somewhat paradoxically) by liberation of acetylcholine at the terminal ganglia (Feldberg and others) In the elasmobranch fishes—for example, shark—the cortex (interrenal body) and medulla (para aortic chromaffin bodies) are quite separate in reptiles they are in more intimate association, but it is only in the mammals that the cortex surrounds the enclosed medulla

From without inwards the cortex consists of three zones—glomerulosa, fasciculata, and reticulosa The inner portion of the latter is known as the pigment zone, the cells having an affinity for osmic acid This may represent the involuted androgenic zone which is concerned with sex and is very large in the foetus The cortex is rich in lipoid containing double refractile crystals It secretes a hormone, cortin, which is essential for life The cells of the medulla, as those of the para aortic chromaffin bodies, have an affinity for chromic acid The medulla secretes adrenaline but is not essential for life

Adrenaline

The essential secretory product of the medulla has the formula $C_9H_{13}O_3N$, dioxyphenylethanolmethylamine and is related to tyrosine and the intermediate product dioxyphenylalanine (dopa) It is prepared by extraction of the mixed glands with dilute acids removal of proteins by alcohol precipitation evaporation of the alcohol and precipitation of the free base by ammonia It can also be obtained from the aortic preganglion of the foetus (Elliott) and from the para-aortic accessory chromophil tissue of dogs, guinea pigs, and rats (Vincent and others) Nevertheless these tissues do not hypertrophy after adrenalectomy

Adrenaline can be assayed colorimetrically (Folin, Cannon and Denis) by its power to reduce tungstic acid to the blue oxide The following biological methods are more sensitive and more specific and are dependent upon the sympathomimetic action of adrenaline (1) inhibition of an intestinal strip suspended in saline (2) inhibition of a muscle strip of the uterus of non pregnant cat, (3) vasopressor response in a spinal animal, (4) dilatation of denervated iris, (5) acceleration of denervated heart etc The rate of secretion of adrenaline was found by Stewart and Rogoff to be 0·00025 mg per kilo of body weight per minute, using the cava pocket method veins entering the vena cava excepting the adrenal veins are clamped, so that a pocket can be formed by occluding the cava beneath the diaphragm and below the entrance of the adrenal veins To obviate the influence of general anaesthesia Satake and others produced anaesthesia by cutting the dorsal roots T9 to L3 and some months later took specimens of blood by syringe directly from the adrenal vein biological assay then showed the output to be only 0·00007 mg per kilo of body weight per minute

Adrenaline acts after section of the sympathetic nerves but not after paralysis of the terminal fibres by apocodeine or ergotoxine Its site of action is therefore the myo neural junction (Langley) Previous nerve section novocain and thyroxine augment the sympathomimetic action of adrenaline Ergotoxine paralyses vasoconstrictor fibres and after its use adrenaline has a vasodilator and vasodepressor action instead of the normal vasoconstrictor and vasopressor action Adrenaline produces acceleration and irregularity (with extrasystoles) of the heart with fatal dilatation Particularly after chloroform is there a tendency to ventricular fibrillation In moderate doses there is an increase in pulse rate, blood pressure, and cardiac output The cerebral and pulmonary arteries may be slightly constricted but the coronaries are dilated Respiration tends to become shallow and irregular, with periods of apnoea The bronchioles are dilated, especially if previously in a state of spasm The movements of the stomach are inhibited by injections of adrenaline but when given by mouth jejunal colic occurs Movements of the human pregnant uterus are inhibited (Bourne and Burn), but the cat's uterus is contracted if pregnant relaxed if not In the guinea pig dilatation of the pupil and exophthalmos may result from adrenaline but this effect is much more marked with ephedrine This is also true of the pilomotor action Sweating may be obscured by the accompanying vasoconstriction The temperature and basal metabolic rate are increased Coagulation time is diminished Adrenaline produces contraction of smooth muscle—for example, spleen—and has an important influence on haemopoietic centres or depots Thus an injection is followed by increase in the number of red cells, lymphocytes, leucocytes and platelets

Adrenaline and Carbohydrate Metabolism

Adrenaline accelerates glycogenolysis in both liver and muscle thus increasing the blood sugar and the blood lactic acid After hepatectomy only the lactic acid is increased The hyperglycaemia and glycosuria that result from puncture of the floor of the fourth ventricle (Claude Bernard) are partly due to the release of adrenaline and partly to direct nervous transmission of the impulse to the liver Denervation of the adrenals or cauterization of the medulla will diminish the severity of diabetes mellitus resulting from pancreatectomy By cross circulation experiments acceleration of the denervated heart increase of erythrocytes and leucocytes and other methods it can be proved that adrenaline is secreted during insulin hypoglycaemia That there is normally an antagonism or balance between adrenaline and insulin secretion is further suggested by Cori's observation that the adrenaline effects on carbohydrate metabolism could all be obtained if adrenaline was injected at a rate and concentration no greater than that at which it is secreted in the anaesthetized animal

Adrenaline and Cannon's Emergency Theory

Cannon has produced evidence (not undisputed) that 'afferent stimulation asphyxia and emotional excitement cause a quick and abundant secretion of adrenaline This would aid the organism in an emergency by in-

Surgeon Lieutenant D Ewart has been transferred to the Emergency List

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant J F Heggie to be Surgeon Lieutenant Commander

ROYAL ARMY MEDICAL CORPS

Lieut Col A H T Davis, having attained the age for retirement has been placed on retired pay

Major and Brevet Lieut-Col D C Monro to be Lieutenant Colonel

Captain F McL Richardson to be Major (Substituted for notification in the *London Gazette* of October 13 1936)

Lieutenant (on probation) J A V Nicoll has been seconded under the provisions of Article 213, Royal Warrant for Pay and Promotion, 1931

ROYAL AIR FORCE MEDICAL SERVICE

Squadron Leaders P H Perkins to R A F Station Ismailia, Egypt, A Harvey to Directorate of Medical Services Air Ministry, for Staff duties B W Cross to Aircraft Depot Hinaidi Iraq for duty as Senior Medical Officer, Iraq Levies, and Officer Commanding Levy Hospital, Hinaidi

Flight Lieutenants L S Everett to Headquarters, R A F Middle East, Cairo, Egypt F H Peterson to No 4 Flying Training School Abu Sueir, Egypt J F Ziegler to R A F Station, Cilshot

Flight Lieutenants H Bannerman and I Mackay have been granted permanent commissions in that rank

Flight Lieutenant H S Barber has been transferred to the Reserve, Class D

Flight Lieutenant M T O'Reilly has resigned his permanent commission

Flying Officer R F Wynroe to be Flight Lieutenant, with seniority December 2 1935

Flying Officer W J Mitchell has resigned his short service commission

Flying Officers R M Outfin to No 1 Armament Training Camp Catfoss D G Smith to No 3 Armament Training Camp Sutton Bridge W T Buckle D F Cameron H O B Howat, J H Lewis J D Milne S Paul E S Sidney and J C Taylor to Medical Training Depot Hilton on appointment to short service commissions

AUXILIARY AIR FORCE MEDICAL BRANCH

Flight Lieutenant H W Walter has relinquished his commission on completion of service

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Col R Jackson T D, has vacated the appointment of Honorary Colonel R A M C Units 55th West Lancashire Division, Territorial Army, on completion of tenure

Col J G Martin T D to be Honorary Colonel R A M C Units 55th West Lancashire Division Territorial Army

Lieut Col W F Mackenzie T D, has resigned his commission and retains his rank with permission to wear the prescribed uniform

Lieutenants O T Wade and J C H Speirs to be Captains

To be Lieutenants Lieutenant R Ropner, late 5th Battalion Durham Light Infantry Lieutenant G O Montgomery late Territorial Army Reserve of Officers N M Stephen

Supernumerary for Service with the O T C—A W D Leishman late Cadet Sergeant Westminster School Contingent, Junior Division O T C to be Lieutenant

INDIAN MEDICAL SERVICE

Captain G F Taylor in officiating Agency Surgeon has been confirmed as an Agency Surgeon under the Government of India in the Foreign Political Department as from December 18 1935

The services of Captain A E Kingston have been placed temporarily at the disposal of the Government of Burma as from November 11 1936

On reversion from foreign service under the Indian Research Fund Association Captain J R Dogra has been appointed as [illegible] Officer at the Haffkine Institute Bombay

[illegible] has resigned his commission

PSYCHOLOGICAL MEDICINE

PETITION FOR FORMATION OF GROUP

The following petition for the formation of a Group of Psychological Medicine within the British Medical Association has been addressed to the Council

We the undersigned members of the British Medical Association engaged in the study and practice of Psychological Medicine, beg hereby to make petition that a Group of Psychological Medicine be established within the British Medical Association

Psychological medicine is a specialty of increasing importance It is a specialized branch of medicine, and the number of members who practise this specialty in any one Division of the Association is too small adequately to present their problems We are therefore of the opinion that the formation of a Group of those limited in their practice to psychological medicine would be an advantage not only to the specialty but to the Association

Such a Group would deal, *inter alia*, with the conditions affecting the work in this specialty, principally concerning itself in the case of those engaged in public services with the conditions and regulations of those services

With reference to paragraph 4 of the Rules for the Government of Groups, we desire to state that membership of the Group should be confined to those members of the Association who are engaged predominantly in the practice of psychological medicine, and who sign a declaration to that effect

BRITISH MEDICAL ASSOCIATION

PROCEEDINGS OF COUNCIL

WEDNESDAY JANUARY 20 1937

A meeting of the Council of the Association was held at the B M A House, London on Wednesday January 20 when there were present

Dr E. Kaye Le Fleming (Chairman of Council) in the chair Mr H S Souttar (Chairman of Representative Body) Mr N Bishop Harman (Treasurer) Professor R J Johnstone (President Elect) Dr H G Dain (Deputy Chairman of Representative Body) Mr J Armstrong Professor R J A Berry Dr J W Bone Sir Henry Brackenbury Professor A H Burgess, Dr J D Comrie Mr W McAdam Eccles Sir Crisp English Dr C E S Flemming Dr E R Fothergill Mr J L Gilks Dr P L Giuseppi Dr L G Glover Dr F W Goodbody Dr R G Gordon Lieut Colonel C H H Harold Dr C O Hawthorne Dr J Hudson Dr J Hunter Mr E Lewis Lilley Dr P Macdonald Sir Ewen Maclean Dr O Marriott Dr J C Matthews Dr J B Miller Dr H J Milligan Dr L A Parry, Dr W Paterson Professor R M F Picken Dr H W Pooler Colonel A H Proctor Dr J R Prytherch Dr H Robinson Dr E H Snell Dr P B Spurgin Surgeon Rear Admiral A R Thomas Dr W E Thomas Dr G Clark Trotter Dr S Wand Mr N E Waterfield Dr W Watkins Pitchford, Dr W N West Watson Dr W G Willoughby

[illegible] were received from Sir E Farquhar [illegible] ames Barrett (Past President) Dr T [illegible] Dr H C Jonas Dr R Langdon Down Dr J C Loughridge Dr J S Manson Sir Richard Needham Mr R L Newell Dr J P Shanley Dr D Lyon Stevenson Wing Commander H M Stanley Turner Dr F T H Wood

Preliminary Business

The Chairman reported the deaths of Lieut Colonel R H Elliot a former member of Council and Dr C Courtenay Lord a former Assistant Medical Secretary and he was authorized to send letters of condolence to the families

A letter was read from the Keeper of the Privy Purse intimating that the societies which had recently been granted patronage by King Edward VIII might continue to show the Sovereign as their Patron during the present reign unless otherwise notified The Council resolved that a loyal address be presented to its Patron King George VI tendering on behalf of the members of the Association distributed throughout the Empire their congratulations upon his accession and expressing the fervent hope that the King and Queen might have many years of happiness together and that the reign might be long illustrious and blest with peace

A letter was placed before the Council from Dr W N Robertson of Brisbane conveying greetings to the Chairman and members happy recollections of the Australasian visit in 1935 and the hope that at some future date the Association might see its way to visit Queensland Dr T C Routley general secretary of the Canadian Medical Association had also sent a cordial invitation to a meeting in Toronto at the earliest convenient date The Chairman reminded the Council that the Association was to meet in South Africa in 1941 and that it had been more or less agreed that an interval of five years should separate oversea meetings But these invitations would always be in their minds

Various invitations from outside bodies to appoint delegates or representatives were considered The Council appointed Dr W H F Oxley as a representative of the Association at the seventh English speaking Conference on Maternity and Child Welfare to be held in London in June and endorsed a nomination which had been made by the Chairman of Dr F G Thomson of Bath to act as a representative on the Council of the Empire Rheumatism Campaign a body whose object is to organize research throughout the Empire into the causes and means of treatment of rheumatic disease

The Council at its previous meeting had agreed to set up again a Physical Education Committee to continue and establish as might be opportune the work of the large committee of that name which issued its report a year

Branch and Division Meetings to be Held

DUNDEE BRANCH.—At University College, Dundee, Tuesday, February 2, 8.30 p.m. Miss Agatha H. Bowley: Psychological Aspect of Child Development.

GLASGOW AND WEST OF SCOTLAND BRANCH: LANARKSHIRE DIVISION.—At County Hospital, Motherwell, Wednesday, February 3, 8.15 p.m. Film of B.M.A. World Tour, 1935.

HERTFORDSHIRE BRANCH: EAST HERTFORDSHIRE DIVISION.—At the Cherry Tree, Welwyn Garden City, Friday, February 5, 8 p.m. Annual dance.

METROPOLITAN COUNTIES BRANCH: CITY DIVISION.—At Metropolitan Hospital, Kingsland Road, E., Tuesday, February 2, 9.30 p.m. Sir Pendrill Varrier-Jones: The Papworth Settlement.

METROPOLITAN COUNTIES BRANCH: NORTH MIDDLESEX DIVISION.—Wednesday, February 3. Symposium on Nutrition.

METROPOLITAN COUNTIES BRANCH: WOOLWICH DIVISION.—At Woolwich War Memorial Hospital, Friday, February 5, 8.45 p.m. Mr. J. F. O'Malley: Chief Clinical Aspects and Treatment of Nasal Sinusitis.

NORTH OF ENGLAND BRANCH: MORPETH DIVISION.—At Grand Hotel, Ashington, Friday, February 5, 8 p.m. Mr. J. K. Stanger (North Shields): Back Injuries. Members of the Blyth Division are invited to attend.

NORTH OF ENGLAND BRANCH: NORTH NORTHUMBERLAND DIVISION.—At Blue Bell Hotel, Belford, Wednesday, February 17, 3 p.m. Dr. Mason Bolam (Newcastle upon Tyne): Common Skin Diseases and their Treatment.

NORTH WALES BRANCH.—At Craigside Hydro, Llandudno, Friday, February 5, 3 p.m. Discussion on formation of a Public Medical Service for Llandudno and district. Address by Dr. R. W. Durrand (Assistant Medical Secretary): Public Medical Service: Its Value to the General Practitioner and the Public. All local medical practitioners are invited to attend.

NORTHERN IRELAND BRANCH.—At Whitla Medical Institute, College Square North, Belfast, Thursday, February 4, 4.30 p.m. Wing-Commander E. J. Hodsall and Major H. S. Blackmore: 'Air Raid Precautions from the Medical Aspect, with Special Reference to Gas.' Non-members and senior medical students are invited to attend.

STIRLING BRANCH.—At Falkirk Infirmary, Wednesday, February 3. Cellona film on technique of treatment of fractures.

SURREY BRANCH: KINGSTON-ON-THAMES DIVISION.—At Public Assistance Department, Norbiton, Friday, February 5, 8.30 p.m. Colonel G. Wallace: Air Raid Precautions and Anti-gas Treatment.

SUSSEX BRANCH: HASTINGS DIVISION.—At Queen's Hotel, Hastings, Tuesday, February 2, 8.30 p.m. Dr. Temple Grey: Some Medico-Legal Conundrums.

SUSSEX BRANCH: WEST SUSSEX DIVISION.—At Royal West Sussex Hospital, Chichester, Friday, February 5, 8.30 p.m. Divisional meeting.

YORKSHIRE BRANCH: HUDDERSFIELD DIVISION.—At George Hotel, Huddersfield, Wednesday, February 3, 8.45 p.m. B.M.A. Lecture by Dame Louise McIlroy: 'Indications For and Against Surgical Intervention in Obstetric Practice.' Preceded by informal dinner at 7.30 p.m.

YORKSHIRE BRANCH: WAKEFIELD, PONTEFRACT AND CASTLEFORD DIVISION.—At Strafford Arms Hotel, Wakefield, Thursday, February 4. Mr. D. W. Currie (Leeds): Modern Methods in the Conduct of Midwifery. Preceded by dinner at 7.45 p.m.

Meetings of Branches and Divisions

NORTHERN TRANSVAAL BRANCH: EASTERN TRANSVAAL DIVISION

The annual general meeting of the Eastern Transvaal Division was held at the Hydro Hotel, Machadodorp, on November 15, 1936, when Dr. H. O. Eksteen was in the chair. The chairman in declaring the meeting open extended a hearty welcome to Dr. Morris Cohen, who had travelled from Johannesburg under adverse conditions in order to read a paper at the meeting. A letter was read from the Witbank branch of the Transvaal Mine Medical Officers' Association [illegible] of the Division to attend a special [illegible] of medical films at the Witbank Hospital. The [illegible] of income and expenditure was submitted and the annual report of the Division was read and approved. The report recorded that during the year three meetings of the Division had been held, two at Machadodorp and one at Barberton. At the Machadodorp meetings papers were read by Dr. H. S. Roseman and Dr. J. Z. H. Rousseau, both of whom the thanks of the Division were due. At the Barberton meeting Dr. J. H. Sypkens showed some interesting cases and the opinion was expressed that in the general discussion which followed the demonstration much useful knowledge was gained. The following officers were elected:

Chairman: Dr. Sypkens. *Vice-Chairman*: Dr. H. J. E. Schultz. *Honorary Secretary*: Dr. J. A. Levitt.

Dr. Cohen gave an interesting talk on 'Body Build in Relation to Mental Disorder.' The address was illustrated by means of sketches and diagrams, and held the interest of the meeting for over an hour. Mental disease was discussed in an entirely new way. On behalf of the Division the CHAIRMAN thanked Dr. Cohen for his remarks.

SOUTH WALES AND MONMOUTHSHIRE BRANCH

A clinical meeting of the South Wales and Monmouthshire Branch was held at Cardiff Royal Infirmary on December 3, 1936.

Mr. A. L. D'ABREU gave a short account of six cases of pulmonary lobectomy. He briefly indicated the scope of the operation which had been performed for bronchiectasis, neoplasms, lung abscess, and hydatid cyst. The operative mortality rate was now about 10 to 12 per cent. and was considerably less in children. Although the mortality rate was considerable in patients over 45, the lecturer demonstrated a woman of 62 who had successfully withstood lobectomy for hydatid disease of the left lower lobe.

Dr. A. G. WATKINS demonstrated cases of congenital cirrhosis of the liver in two brothers, one aged 10 years and the other 13 years. Dr. Watkins also showed a case of congenital syphilis in a girl aged 9 years who had been admitted to the hospital with a swelling of the left ulna. This was a syphilitic periosteal nodule, and she showed other classical signs of congenital syphilis.

Mr. NATHAN ROCYN JONES discussed the treatment of some deformities of the hip. Cases were shown to illustrate the value of a simple osteotomy of the upper part of the femur.

Dr. LEONARD HOWELLS made some observations on splenic anæmia and Banti's syndrome. Dr. Howells based his observations on an investigation on 100 cases seen at the London Hospital and at the Cardiff Royal Infirmary over a period of five years. Fifty-two of these patients were treated by splenectomy; twenty-eight had died, twenty of these within three years, and the operative mortality was 16 per cent. (nine cases). Twenty-two cases (42 per cent.) were considered to have benefited from treatment. Of the forty-eight patients treated medically twenty-two had died, fifteen within three years. Twenty-five cases (52 per cent.) benefited, and twenty-three cases (48 per cent.) did not benefit from treatment. Splenectomy did not seem to be worth while as a routine measure of treatment in those cases.

SOUTH WALES AND MONMOUTHSHIRE BRANCH: SOUTH-WEST WALES DIVISION

At a meeting of the South-West Wales Division, held at Carmarthen on December 16, 1936, Mr. HOWELL W. GABE (Swansea) delivered a lecture on 'Intestinal Obstruction,' in collaboration with Dr. HYWEL DAVIES (Swansea), who showed a number of x-ray films relating to the subject. Mr. Gabe dealt fully with the causes and changes due to acute, chronic, and the acute supervening on chronic types of obstruction which he illustrated freely with cases from his own practice. In diagnosis Mr. Gabe laid emphasis on the importance of auscultation of the abdomen whenever there was doubt as to the presence of perforation of the stomach or intestine. In treatment Mr. Gabe pointed out the value of anti-gas gangrene serum. He also surveyed the respective actions of acetylcholine and morphine in paralytic conditions. He expressed his complete satisfaction with acetylcholine, which he insisted must be administered in large doses.

STAFFORDSHIRE BRANCH: NORTH STAFFORDSHIRE DIVISION

A general meeting of the North Staffordshire Branch was held at the North Staffordshire Royal Infirmary on December 8, 1936, when Dr. Elizabeth H. Livingston was elected vice-chairman and Dr. A. D. BLAKELY golf secretary. The grouping of constituencies was approved. A long discussion took place on the question of clubs and it was decided to include a notice of a motion on the next agenda that a public medical service be formed. It was reported that the executive committee had had an interview with the medical officer of health for Stoke-on-Trent, at his request, to discuss the new Midwives Act. It was arranged that he should meet the whole profession of the area at the next meeting of the Division and he expressed a wish to work in harmony with the local profession as much as possible.

ance upon juveniles and adults This entailed the rescind ing of a resolution of the Annual Representative Meeting 1928 approving a lower rate for juveniles

Other medico political proposals which were agreed to concerned an increase in the remuneration of certifying factory surgeons to 7s 6d per case for a complete exam ination and for certification of young persons under the Factories Acts and to one guinea for special examination and report on forms 190 500 or 1830 subject to a reduc tion where a number of cases were reported on at the same time This substantial increase is to be pressed for in view of the impending revision of factory legislation

Liabilities of Hospital Authorities

Dr Macdonald, for the Hospitals Committee reported that a conference had been held with other interested bodies to consider the issues arising from the House of Lords judgement in the case of Lindsey County Council v Marshall which sharply brings forward the liabilities of hospital authorities and of local authorities in respect of institutions maintained by them The view of the con ference was that before any definite action was decided upon the opinion of counsel should be taken the cost to be borne in equal proportions by the participating bodies He moved that authority be given to incur the legal expenditure necessary

Professor Picken in supporting the motion pointed out that there was no clear line of demarcation between the responsibilities of the hospitals and of the medical staffs who worked in them It used to be thought that there were quite a number of judgements making it perfectly clear that the medical man had a responsibility for his own actions and that hospitals were not responsible so long as they had appointed an officer of due competence and qualification But this recent decision had altered all that The courts would now hold that a medical officer might be acting as agent for the hospital in certain circum stances but just where that responsibility began and ended no one knew

The recommendation was agreed to

Other matters on the Hospitals Committee's report in cluded the setting out of certain principles for the guidance of hospitals in the appointment and employment of junior resident medical officers a matter on which headquarters is often being consulted But this and other questions arising on this report and also on the report of the Public Health Committee have already been explained in the *Supplement*

Consultants' List for Scotland

Dr Comrie for the Consultants and Specialists Group Committee for Scotland brought forward a draft scheme for the provision of consultant and specialist services at reduced fees for persons entitled to medical benefit under the Insurance Acts and others of like economic status The scheme which had been approved at a general meeting of members of the Group followed the metropolitan system It divided the persons coming under the scheme into three classes with income limits of £200 £250 and £300 respectively and gave the right to apply for admission to the consultants list to all practitioners who satisfied the usual criteria The Consultants Board which would organize and administer the service would consist of the Group Committee for Scotland and in addition the Royal College of Physicians of Edinburgh the Royal College of Surgeons of Edinburgh and the Royal Faculty of Physicians and Surgeons of Glasgow would each be invited to nominate one direct representative on the Board It was also proposed that provision be made for consultations in the patient's house where necessary and a scale of fees increasing with mileage had been worked out Dr Comrie said that if the Council gave per mission immediate steps would be taken to get the Board constituted

Professor Burgess was disappointed to find that Scot land had followed the example of London Much [illegible] heard of the success of the London [illegible] depended on the angle from which it was far more personal touch between [illegible] general practitioners in the provinces than [illegible] the provinces had found no need for [illegible] of the economic status mentioned when [illegible] for a consultation could have such [illegible] reduced fee or often for no fee at [illegible] consultation fee in the provinces was [illegible] cept in Birmingham and Sheffield where [illegible] guineas and to reduce it to one guinea was [illegible] oppressive to young consultants

Dr Hawthorne in reporting a little later [illegible] Consultants Board for London said that no [illegible] been made of those practitioners whose name [illegible] on the list as to the extent of the use made of [illegible] 1935 Replies had been received from [illegible] practitioners concerned who stated that [illegible] number of patients seen by them during that [illegible] over 1 500 From these figures it might be concluded that the establishment of the list had meant the payment of a modified consultation fee by a number of persons who otherwise would have obtained gratuitous hospital advice

Dr J B Miller chairman of the Scottish Committee said that there were various occupational groups in Scotland which were providing services with closed panels This fact had hastened the proposal of the Group Com mittee The question of the effect upon such places as Newcastle and Carlisle had been mentioned There could be no difficulty in the case of Newcastle which was separated from the Border by sixty miles of uninhabited country As regards Carlisle there were physicians and surgeons in that city who certainly acted as consultant in some of the southern counties of Scotland but he believed that the matter was open to arrangement

The Scottish scheme was approved and the Group Committee authorized to take the necessary steps to inaugurate it Dr Miller also reported for the Health Services Committee which is at present considering the recommendations of the Departmental Committee on Scottish Health Services in their relation to the policy of the Association

Ethical Questions

The report of the Ethical Committee brought forward by Dr Waterfield referred to two matters on which some discussion arose A member of the Association had sought the advice of the General Medical Council on the propriety of the issue by him of a circular letter to his professional colleagues informing them of the facilities which he could offer in a private capacity for patho logical examinations The President of the Council had at first replied that the issue of any such announce ment would appear to be liable to give rise to complaint to the Council under one of its Warning Notices This reply was in conflict with the Association decision that a practitioner engaged in private practice as a pathologist was at liberty to notify that fact together with his pro fessional address to medical practitioners within the area of his practice Subsequently however there had been a letter from the General Medical Council somewhat modifying its former attitude Sir Henry Brackenbury pointed out that the General Medical Council had power to erase a practitioner's name from the *Medical Register* for unprofessional conduct if such conduct was of character which the general body of the profession would condemn In the unlikely event of a case of the kind mentioned in the correspondence being a subject of com plaint those representing the respondent could urge that the British Medical Association had made a distinct pro nouncement on the subject and he did not think the General Medical Council could possibly say in that event that the conduct was held to be unprofessional by the general body of the practitioner's colleagues

if a middle-aged patient was seen complaining of symptoms referable to the heart, after first eliminating hypertension, valvular lesions or the so-called cor pulmonale, there was a very large group of cases in which there was myocardial insufficiency due to coronary artery disease. He described the change which takes place in the coronary arteries through the various decades, classified the various pathologies which may result from coronary artery change and described the symptomatology resulting from coronary narrowing in those patients in whom there was no anginal pain and where congestive heart failure had not made its appearance. He mentioned the lesions and associated conditions which might precipitate symptoms in the presence of coronary atheroma—for example, gall-bladder sepsis masked hyperthyroidism, myxoedema—and finally discussed the management of the state of waning myocardial reserve. An interesting discussion followed.

BOOKS ADDED TO THE LIBRARY

The following books were added to the Library of the British Medical Association during December, 1936.

Abrahams, H. M., and Abrahams, A. Training for Health and Athletics. 1936.
Bray, G. W. Recent Advances in Allergy. Third edition. 1937.
Brockbank, E. M. Foundation of Provincial Medical Education in England and of the Manchester School in Particular. 1936.
Brook, G. B. Experimental and Clinical Studies of the Spine of the Dog. 1936.
Brown, P. American Martyrs to Science through the Roentgen Ray. 1936.
Castle, W. B., and Minot, G. R. Pathological Physiology and Clinical Description of the Anaemias. 1936.
Christopher, F. Minor Surgery. Third edition. 1936.
Dunning, W. B., and Davenport, S. L. Dictionary of Dental Science and Art. 1936.

Young, P. T. Motivation of Behavior. 1936.

POST-GRADUATE COURSES AND LECTURES

FEBRUARY AND MARCH

The following post-graduate courses and lectures to be held in London during February and March, have been notified to the British Medical Association. Further particulars may be obtained direct from the hospitals concerned or, in the case of arrangements made by the Fellowship of Medicine (F.M.) from the Secretary of the Fellowship, 1, Wimpole Street, W.1.

Subject	Date	Place of Meeting	Nature of Instruction
Chest Diseases	Feb. 1-6	City of London Hospital for Diseases of Heart and Lungs, Victoria Park, E.2	Joint Tuberculosis Council course
Dermatology (continued)	Feb. 1-27	St. John's Hospital for Diseases of the Skin, 5, Lisle Street, Leicester Square, W.C.2	F.M. course
Experimental Endocrinology	Feb. 3, 10, 17	British Post Graduate Medical School, Ducane Road, W.12	Last three lectures of course
Gynaecology	Feb. 8-20	Chelsea Hospital for Women, Arthur Street, S.W.3	F.M. course
Hygiene of the Foetus and the Newborn Child	Feb. 4, 11	British Post Graduate Medical School, Ducane Road, W.12	Last two lectures of course
Nephritis and Allied Conditions	Feb. 1, 8, 15	British Post Graduate Medical School, Ducane Road, W.12	Last three lectures of course
Neurology (continued)	Feb. 1-Mar. 19	National Hospital, Queen Sq., W.C.1	Course of lectures and demonstrations
Surgical Diseases of the Rectum	Feb. 5	British Post Graduate Medical School, Ducane Road, W.12	Last lecture of course

In addition to the above courses the following for the higher qualifications have been arranged:

Subject	Date	Place of Meeting	Degree or Diploma
F.M. Surgical Tutorial Classes (cont.)	Feb. 2, 25, Mar. 2, 4	National Temperance Hospital, Hampstead Road, N.W.1	F.R.C.S. (Final)
Anatomy and Physiology	Feb. 22-Mar. 24	Infants Hospital, Vincent Sq., S.W.1	F.R.C.S. (Primary)
F.M. Demonstrations of Clinical Cases and Pathological Specimens	Feb. 16, 18, 23, 25, Mar. 2, 4	National Temperance Hospital, Hampstead Road, N.W.1	M.R.C.P.
L.C.C. Course XX, Parts I and II, Psychological Medicine (cont.)	Feb. 1-22	Maudsley Hospital, Denmark Hill, S.E.5	D.P.M.

POST-GRADUATE NEWS

The Fellowship of Medicine announces that surgical tutorial classes, especially intended for Final F.R.C.S. candidates, will be held at National Temperance Hospital on Tuesdays and Thursdays at 8.30 p.m. as follows: February 2, Kidney and Bladder; February 4, Tongue; February 9, Infection of Bones; February 11, Disease of and Injuries to Joints, Muscles, and Tendons. A special course in preparation for the Primary F.R.C.S. examination will be given at Infants Hospital on Mondays, Wednesdays and Fridays from February 22 to May 24, physiology class at 5.15, and anatomy class at 6.30 p.m. An intensive course in gynaecology will be given at Chelsea Hospital for Women from February 8 to 20, and a general practitioners' course in medicine, surgery, and gynaecology will be held at Royal Waterloo Hospital from February 22 to March 6. A course in children's diseases will be given at Princess Elizabeth of York Hospital on February 20 and 21. M.R.C.P. courses will be given as follows: clinical and pathological course, National Temperance Hospital, Tuesdays and Thursdays at 8 p.m., February 16 to March 4; chest diseases, Brompton Hospital at 5 p.m. twice weekly, February 22 to March 20; heart and lung diseases, Royal Chest Hospital, Mondays, Wednesdays and Fridays at 8 p.m., March 1 to 20; and neurology, West End Hospital for Nervous Diseases, every afternoon from March 8 to 20.

The following lecture-demonstrations have been arranged by the South West London Post-Graduate Association at

Messrs Hempsons were reappointed solicitors of the Association for a further year

A good deal of domestic detail relating to the Association premises was brought forward in the report of the Building Committee introduced by Dr Dain

It was mentioned that gifts had been made to the Association by the Wellcome Foundation in the shape of a replica of a medal and for the Scottish House by Dr N P Fairtax of an oil painting by John Nesbitt and by Dr C O Hawthorne of books for the library

The final matter dealt with was finance Mr Bishop Harman reported that the second largest Branch in the Association Lancashire and Cheshire had followed the lead of the Metropolitan Counties Branch in asking the Head Office to keep the Branch accounts

The Council which met at 10 a m rose a little before 6 p m

NOTES OF THE WEEK

Medical Instruction in Anti gas Measures

The Home Office has recently issued to local authorities in England and Wales a circular letter describing the scheme of medical instruction in anti gas measures and inviting the authorities to co operate with the local Branches of the British Medical Association in making the scheme economical and effective The following paragraphs are of particular interest

The instructors and the necessary equipment are being provided by this Department without charge and the only cost which will fall to be met locally will be the cost (if any) of the accommodation for the local course and minor office expenses of organization This local cost should not properly fall on the funds of a voluntary organization such as the British Medical Association and it is therefore intended that a small enrolment fee should be charged to those who attend the courses This fee can never be large unless a substantial sum has to be paid for accommodation and to keep it as low as possible the Secretary of State would be grateful if in cases where free accommodation is not available in a hospital or similar premises the local authority in the area in question could assist in providing accommodation in some public building

It is suggested that the local authority's medical officer of health should keep in touch with the local Branch or Branches of the British Medical Association and so be able to keep acquainted with the progress of medical training in the locality as well as to give any assistance which it may be in his power to afford

Hospital Co operation in Liverpool

An important step towards hospital co ordination is represented by the Liverpool United Hospital Bill, which is now before Parliament It is proposed that the Liverpool Royal Infirmary, the David Lewis Northern Hospital the Liverpool Stanley Hospital, and the Royal Southern Hospital which are all general voluntary hospitals shall be amalgamated and incorporated under the name of the Liverpool United Hospital The new organization will thus form a hospital centre in Liverpool comparable with that which is being formed in Birmingham The general committee will consist of representatives of the governing body of each of the existing hospitals the medical staffs of the hospitals the University of Liverpool and the Merseyside Hospitals Council The general objects of the new hospital include the usual hospital work the conduct of medical schools in co operation with the University of Liverpool the pursuit of medical research and the education and training of nurses Among the subsidiary powers given to the hospital by the Bill are the granting of facilities to local authorities and other bodies for the use of beds and other services provided at the hospital and the authorization of members of the honorary medical and surgical staffs to charge fees to paying patients

Research in Rheumatoid Arthritis

Dr William Goldie has been appointed director of the Leeds Public Dispensary in connexion with rheumatoid arthritis The appointment is for [illegible] and it is proposed that Dr Goldie shall [illegible] extending over a period of seven years

Municipal Midwifery Service

The Sunderland Health Committee has approved a scheme for the appointment of fifteen [illegible] under the Midwives Act 1936 It is proposed that for the purpose of the midwifery service the town shall be divided into four districts each with its own [illegible] salaried midwives The patient will engage her own midwife direct and so far as possible she will have a free choice from the panel Schemes for municipal midwifery services have been prepared by the local authorities of Bath Gloucestershire Hull Leyton Manchester Northampton Southport and Stockton

The Sunderland Public Assistance Committee has decided to increase the salaries of six district medical officers by £100 a year each The decision is the result of representations made by a deputation from the local profession to the effect that the present remuneration of the district medical officers is not commensurate with the amount of work they are expected to perform

The subscription rates of the Chesterfield and District Public Medical Service have been increased It is hoped that the new rates will enable the members to secure a capitation payment which will approximate to the national health insurance *capitation fee*

The Surrey County Council proposes to build a large general hospital with 832 beds on the St Helier estate at Carshalton

Dr W B Watson has retired after twenty eight years practice in the Aber Valley

ANNUAL MEETING IN BELFAST

HOTEL AND LODGING ACCOMMODATION

The facilities for housing the members who contemplate visiting Belfast for the Annual Meeting next July has given the local committee a considerable amount of anxiety but it is anticipated that the facilities available will meet the requirements of all visitors A list of suitable hotels will be published shortly in the *Supplement* but in the meantime it may be stated that those desirous of arranging their accommodation now can do so

The booking of *hotel accommodation* has been placed exclusively in the hands of Messrs Thos Cook and Son and if applications are made at their office 27 Royal Avenue Belfast they will allocate rooms in order of application No booking fee is charged but a small deposit will be asked for on reservation being made the deposit will be credited when the account is settled or returned if it is found that the room is not required

A register of *lodgings* is in course of preparation various students hostels also are available [illegible] these will be arranged through the Local Executive Office and applications for hostel or board and lodging accommodation should be addressed to the Secretary B M A Whitla Medical Institute College Square N Belfast

A number of residents have offered *private hospitality* and this will also be available These members desirous of utilizing this should also apply to the secretary at the above address

VACANCIES AND APPOINTMENTS

GLOUCESTER BARNWOOD HOUSE REGISTERED MENTAL HOSPITAL—Medical Superintendent (male) Salary £1,500 p a

GREAT YARMOUTH GENERAL HOSPITAL—H S (male, unmarried) Salary £140 p a

GRIMSBY AND DISTRICT HOSPITAL—Orthopædic S and S in Charge of Fracture Clinic Honorarium £350 p a

GROCERS' COMPANY, Grocers Hall, E C—Three Medical Research Scholarships Value £300 p a each

GUILDFORD ROYAL SURREY COUNTY HOSPITAL—H S (male) Salary £150 p a

HEREFORD HEREFORDSHIRE GENERAL HOSPITAL—Hon P in charge of the Cardiological Department

HERTFORDSHIRE COUNTY COUNCIL—A M O (male, unmarried) at Ware Park Sanatorium Salary £300 p a

HOSPITAL OF ST JOHN AND ST ELIZABETH Grove End Road N W—Clinical Assistant to the X Ray Department Honorarium £75 p a

HUDDERSFIELD ROYAL INFIRMARY—(1) C O (2) H P and Resident Anæsthetist Males Salaries £200 p a and £150 p a respectively

ILFORD KING GEORGE HOSPITAL—Hon P to the Dermatological Department

ISLINGTON DISPENSARY Upper Street, N—A R M O (female unmarried) Salary £250 p a

KEIGHLEY BOROUGH—Deputy M O H and Assistant School M O (female) Salary £500 £25 £700 p a

LANCASTER ROYAL ALBERT INSTITUTION FOR FEBLE MINDED—R J A M O (male, unmarried) Salary £375

LEEDS PUBLIC DISPENSARY AND HOSPITAL—Anæsthetist Honorarium £26 5s p a

LIVERPOOL AND DISTRICT HOSPITAL FOR DISEASES OF THE HEART—H P Salary £100 p a

LIVERPOOL EYE EAR AND THROAT INFIRMARY—Ophthalmic H S Salary £120 p a

LIVERPOOL ROYAL SOUTHERN HOSPITAL—Hon Assistant Orthopædic S

LIVERPOOL SANATORIUM Delamere Forest—(1) Senior Assistant (2) Junior Assistant Males, unmarried Salaries £325 p a and £225 p a respectively

LIVERPOOL WATERLOO AND DISTRICT GENERAL HOSPITAL—H S Salary £100 p a

LONDON COUNTY COUNCIL—(1) A M O (Grade I) and (2) A M O (Grade II) at Queen Mary's Hospital for Children Carshalton Unmarried Salaries £350 £25 £425 p a and £250 p a respectively

LONDON HOSPITAL E—Paterson Research Scholar and Chief Assistant in the Cardiac Department Salary £400 p a

LOWESTOFT AND NORTH SUFFOLK HOSPITAL—J H S (male) Salary £120 p a

MAIDSTONE KENT COUNTY OPHTHALMIC AND AURAL HOSPITAL—H S (male unmarried) for the Ear, Nose, and Throat Department Salary £250 p a

MAIDSTONE WEST KENT GENERAL HOSPITAL—H P (male) Salary £175 p a

MANCHESTER CITY—R A M O (male) at Booth Hall Hospital for Children Salary £200 p a

MANCHESTER ROYAL INFIRMARY—Non resident Chief Assistant to the Surgical Unit Salary £250 p a

NEWCASTLE UPON TYNE CITY AND COUNTY—Resident Medical Assistant at the Barrasford Sanatorium Salary £250 p a

NEWCASTLE UPON-TYNE JOINT COMMITTEE OF THE COUNTY COUNCILS OF DURHAM AND NORTHUMBERLAND AND THE COUNTY BOROUGH COUNCILS OF GATESHEAD AND NEWCASTLE UPON TYNE FOR THE ADMINISTRATION OF A VENEREAL DISEASES CLINIC AT THE NEWCASTLE GENERAL HOSPITAL—Whole time M O in Charge (male) Salary £800 £50 £1 000 p a

NEWPORT COUNTY BOROUGH—Assistant M O H (female) Salary £500 £25 £700 p a

NORFOLK COUNTY COUNCIL—(1) Temporary A M O Salary £500 £25 £575 p a (2) Dental S Salary £500 £25 £575 p a

NORTHAMPTON MENTAL HOSPITAL Berrywood—Third A M O (male unmarried) Salary £450 £25 £500 p a

NORWICH NORFOLK AND NORWICH HOSPITAL—H S (male unmarried) to the Special Departments Salary £120 p a

NOTTINGHAMSHIRE COUNTY COUNCIL—Whole time M O to act as (*a*) A M O to the County Council (*b*) M O H to West Bridgford Urban District and (*c*) M O H to Bingham Rural District Salary £800 p a

NOTTINGHAM GENERAL HOSPITAL—H S (male) for Fracture and Orthopædic Departments Salary £300 p a

OXFORD WINGFIELD MORRIS ORTHOPÆDIC HOSPITAL—R H S Salary £100 p a

OXFORD UNIVERSITY—Philip Walker Studentship in Pathology

PENDLEBURY ROYAL MANCHESTER CHILDREN'S HOSPITAL—Non resident A M O for Out patient Department Salary £150 p a

PORTSMOUTH CITY Part time Eye Consultant to St Mary's Hospital Remuneration £2 12s 6d per visit

PRINCE OF WALES'S HOSPITAL Devonport—J H S Salary £100 p a

PRINCE OF WALES'S HOSPITAL Greenbank Road—[illegible] and H S to the Special Departments Salary £100 p a

PRINCE OF WALES'S HOSPITAL Lockyer Street—H S Salary £100 p a

PRINCESS ELIZABETH OF YORK HOSPITAL FOR CHILDREN Shadwell E—Assistant S

QUEEN CHARLOTTE'S MATERNITY HOSPITAL Marylebone Road N W—R M O for the Isolation Hospital Hammersmith W Salary £100 p a

QUEEN MARY'S HOSPITAL FOR THE EAST END E—Hon Assistant P to the Department of Psychological Medicine

QUEEN'S HOSPITAL FOR CHILDREN, Hackney Road, E—C O Salary £100 p a

READING ROYAL BERKSHIRE HOSPITAL—Resident Anæsthetist (male) Salary £250 p a

ROTHERHAM COUNTY BOROUGH—R A M O for Alma Road Hospital Salary £350 p a

ROYAL CANCER HOSPITAL (FREE) Fulham Road S W—H S to the Radium Department Salary £100 p a

ROYAL FREE HOSPITAL, Gray's Inn Road, W C—Hon Assistant P to the Children's Department

ROYAL NORTHERN HOSPITAL Holloway, N—(1) H P (2) Obstetric H S Salaries £70 p a each

RYDE ROYAL ISLE OF WIGHT COUNTY HOSPITAL—J H S (female, unmarried) Salary £120 p a

ST JOHN'S HOSPITAL Lewisham S E—(1) H P (2) C O Males Salaries £100 p a each

ST JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Lisle Street, W C—Medical Registrars to (1) Out patients, and (2) In patients Honorariums £50 p a each

SHEFFIELD CITY EDUCATION COMMITTEE—Assistant School M O Salary £500 £25 £700 p a

SHEFFIELD ROYAL HOSPITAL—Two Whole time Clinical Assistants (non resident) Salaries £300 p a each

SOUTH SHIELDS INCHAM INFIRMARY—(1) Senior H S (2) J H S Males Salaries £200 p a and £150 p a respectively

SOUTHPORT GENERAL INFIRMARY—J H S (unmarried) Salary £150 p a

STOCKPORT COUNTY BOROUGH—Senior Assistant M O H and Clinical Tuberculosis Officer (male) Salary £750 £50 £937 10s p a

STOKE ON TRENT NORTH STAFFORDSHIRE ROYAL INFIRMARY—Two Hon Registrars

SUNDERLAND COUNTY BOROUGH—Consulting Ophthalmic S to the Municipal Hospital Honorarium £25 p a

SWANSEA COUNTY BOROUGH—R M O (male, unmarried) for Hill House Infectious Diseases Hospital Salary £350 p a

TUNBRIDGE WELLS KENT AND SUSSEX HOSPITAL—R S O Salary £250 p a

CERTIFYING FACTORY SURGEONS—The following vacant appointments are announced Newbury (Berkshire), Fillongley (Warwickshire) Dornoch (Sutherlandshire) Applications to the Chief Inspector of Factories Home Office Whitehall, S W 1, by February 9th

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 46 47 48 49 50 51 55 and 56 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 52 53 and 54

APPOINTMENTS

GOLDIE William M B Ch B Research Worker in Rheumatoid Arthritis Leeds Public Dispensary and Hospital

HARRISON N H M R C S L R C P Certifying Factory Surgeon for the Prestegn District (Radnorshire)

ROBERTS Hilda M R C S L R C P Resident Assistant Medical Officer Booth Hall Hospital for Sick Children Manchester

ADMIRALTY SURGEONS AND AGENTS—John Adam, M B, Ch B, for the London District No 16 comprising Holloway, Upper Holloway, Regent's Park, Camden Town, Hampstead, and Kentish Town A MacQuarrie M B, Ch B, for Brightlingsea, R A Walker F R C S for Peterborough

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

BIRTH

DATE—On January 22 1937 to Muriel (née Page), wife of Dr W Adlington Date of Exeter a daughter

DEATH

MATHESON—On January 21 1937 at 191, Latymer Court W 6, Farquhar Mackenzie Matheson, B A Cantab, M R C S, L R C P, late of Pinner Road Harrow

legal actions and when the Association was invited to give evidence in 1926 to the Royal Commission on Lunacy it included in its Memorandum of Evidence on the whole question of the certification and treatment of mental illness a plea for the protection of the medical practitioner by conferring on him when certifying the status of witness. The Royal Commission did not accept the Association's recommendations completely but it is noteworthy that in consequence of later negotiations between the Association and the Ministry of Health the Mental Treatment Act of 1930 considerably strengthens the measure of protection accorded to the certifying practitioner by the Royal Commission's recommendations and in the provision for the treatment of certain cases without certification follows the lines of the British Medical Association's recommendations rather than those of the Royal Commission.

Experiments on Living Animals

On several occasions the Association has opposed Bills which have had for their object the prohibition of experiments on living animals. The Cruelty to Animals Acts already impose upon research workers in this country restrictions by which foreign workers are not hampered but attempts have often been made by certain persons to place still further impediments in their way. Especially effective action to frustrate such attempts was taken by the Association in 1927 when one of a series of Dogs Protection Bills was introduced into Parliament. A conference convened by the Association at which nearly a hundred representatives of universities medical schools and medical and scientific bodies attended passed a strong protest against the imposition of further restrictions upon experimental work on dogs and other animals. The resolutions of the conference were communicated to the Prime Minister and the Home Secretary and they formed the basis of a petition to the House of Commons which was signed by a large number of medical members of university staffs medical schools and teaching hospitals. Divisions and Branches were also asked to urge their respective Members of Parliament to vote against the Bill. Although when the time for the second reading arrived the Bill was talked out owing to the length of the speeches of the mover and seconder there is no doubt that public opinion had been stirred by the Association's action. This impression received confirmation in 1930 when a Bill to prohibit the expenditure of public money on vivisection was introduced. On this occasion the Association sent a letter to all Members of Parliament explaining the full meaning of the term vivisection and largely in consequence of this letter the Bill was refused a first reading.

These few examples of what constitutes part of the everyday work of the Association will serve to illustrate its power to influence legislation. Its work of course is not finished when the Bill concerned is passed for the administration of an Act especially of one which confers general powers calls for equally serious consideration but the frequent recognition of its ideals by Parliament may be regarded as an indication of the valuable part that the Association can play in the development of medical and social legislation.

The Council of the Association has had the pleasure of sending to the New Zealand Branch a number of surplus copies of periodicals for inclusion in the new library which the Branch is creating. A letter has just been received expressing the thanks of the Branch.

PROBLEMS IN PRACTICE

(These columns are devoted to matters of practical interest on which individual members may seek advice at the Head Office of the British Medical Association.)

Fees in Connexion with Coroners' Inquests

The scale of fees payable to a medical practitioner for giving evidence at an inquest and for making post mortem examinations is laid down in the Coroners (Amendment) Act 1926. Section 28 of the Act makes no provision at all for meeting the expenses which a witness has been put on travelling to attend the court. In country districts the amount is considerable. Certain local authorities under the powers given by the Act have authorized the payment of travelling expenses to medical witnesses at inquests. When an inquest is held on more than one body at the same time each body forms the subject of a separate inquisition and a separate fee is payable to the medical witness in respect of each inquisition.

It may happen occasionally that a practitioner is called before a coroner's court to give evidence merely of fact as an ordinary layman might, and not evidence which in any way involves the use of his professional knowledge and position. In this case it is not certain whether he can claim the fees on this scale though it is probable that they will be paid to him. In all cases where he is giving medical evidence however he is entitled to these fees.

Procedure in Scotland in Cases of Sudden Death

The Coroners Act does not apply to Scotland. Duties corresponding to those of that official are discharged by the procurator fiscal who acts also as public prosecutor. In all cases of sudden or suspicious death he must hold an inquiry which in the first instance is a private inquiry and in the course of which he may request a practitioner to make an external examination of the body and to report. If a post mortem examination is deemed necessary he will obtain a warrant authorizing this from the sheriff. Under this authority the medical men (there are usually two) named in the warrant will proceed. They must first secure identification of the body by two witnesses whose names and address must be recorded. Then all persons other than the examiners must leave the room and the examination is conducted according to certain detailed directions prescribed by the authorities. Upon application to the procurator fiscal permission for the presence of a medical practitioner to watch the interests of any accused person may be obtained but such practitioner is not allowed to take part in the examination he is present merely as a spectator. If an independent post mortem examination is desired it can be made after the Crown examination. The report is signed by both examiners unless they differ in opinion when each draws up and signs his own report.

If the procurator-fiscal is satisfied that the death was due to natural causes no further proceedings are taken and the procurator fiscal reports and certifies the cause of death to the registrar. A public inquiry however must be held before a sheriff and jury

(*a*) in the case of a fatal accident occurring in an industrial employment and

(*b*) in any case of sudden or suspicious death whenever it appears to the Lord Advocate to be expedient in the public interest.

In each case the jury is required to return a verdict setting forth so far as has been proved the cause of the

Kendall has prepared a crystalline product, and de Fremery, Laqueur, Reichstein, Spanhoff, and Nyldert have just announced the separation of very active crystals

The maintenance dose of cortical extract, as usually prepared, for different species is approximately rats 1/2 to 1 c.cm., dogs 1 to 2 c.cm., cats 2 to 3 c.cm., and monkeys 6 to 12 c.cm.

Nova et Vetera

MEDICAL HISTORY OF LIVERPOOL[1]

The late Mr. Thomas H. Bickerton was well qualified to write the medical history of Liverpool. He had an ancestral connexion with the city and was one of its leading ophthalmic surgeons. As early as March 3, 1904, he read a paper on the Liverpool Medical Institution, and on October 7, 1909, he gave an inaugural address on Dr. John Rutter. During the rest of his life he continued to collect data for a more general medical history of Liverpool. The results were reduced to book form by Miss May McKisack, B.Litt. It is now issued after revision by Dr. R. M. B. Mackenna, who is in charge of the dermatological department of the Southern Hospital. The resulting volume[1] would have gladdened the heart of Mr. Bickerton could he have lived to see the outcome of his work—a stately quarto of 313 pages well printed on good paper, lavishly illustrated with maps, plans and portraits, and at the moderate price of twenty-one shillings.

The story begins with the building of the Infirmary in 1749 and is continued until 1920. It tells of the formation of the dispensary (1778), the Hospital for the Blind (1796), the fever hospital (1801), the Northern Hospital (1833), and the Royal Southern Hospital in 1841. A noble record of voluntary charity in a city growing in size and in wealth. At first every medical man practised every branch of his profession, but specialism crept in, eyes and ears first, then throats, skins, children, and finally x rays which seem to have attracted attention in Liverpool within a few months of their discovery.

Some Outstanding Names

Many names of the physicians and surgeons are well known. Thomas Robinson said to be an M.D. of Oxford, but of whom there is only the bare university record that he matriculated from Brasenose, at the age of 20, on May 2, 1741. Park and Manson, surgeons in advance of their time. Rutter and Bostock. the Bickersteths, T. H. Waters. Richard Caton, physician, archaeologist, and lord mayor. Mitchell Banks. Reginald Harrison and T. T. Paul, great surgeons. The Thomases, father and son, and Sir Robert Jones all added lustre in their day to the medical circles in Liverpool. From the beginning the Liverpool physicians took an active interest in furthering the interests of the profession through the British Medical Association. We read that in 1832, when the Provincial Medical and Surgical Association—the precursor of the British Medical Association—was formed, four distinguished medical men were on the Council, and no fewer than sixteen essays and cases were contributed to the first volume of *Transactions* by Liverpool practitioners. The Association itself has held four of its Annual Meetings in the city, and the names of Dr. A. T. K. Waters and Sir James Barr will long be remembered as those who did yeoman service in its interests.

Medical Education in Liverpool

The teaching of medicine has always been a strong point at Liverpool. clinical material has been abundant, because it is a seaport with a large migratory population. Long before the School of Medicine was opened in 1834 there were two Schools of Anatomy, with an attendance of about forty medical students, sculptors, and artists. Subjects appear to have been so plentiful that in October, 1826, three casks labelled 'Bitter salts" consigned to a firm in Edinburgh were found to contain eleven dead bodies partially salted and pickled. The private schools of medicine were absorbed by the School of Medicine attached to the Infirmary. This became a faculty first of University College, then of the Victoria University, and finally of the University of Liverpool. Side by side with it was the University School of Hygiene and the much needed School of Tropical Medicine which has done magnificent work in connexion with our Dominions in the Tropics.

There is an interesting chapter on the development of nursing from the time when it was proposed to secure the services of a better type of nurse at the Infirmary by raising the salary from £10 to £16 a year. The matron reported that she only had four nurses whom she could trust not to celebrate such a rise in prosperity by getting drunk on quarter day. There is, too, a terrible picture of the sanitary condition of the city even as late as 1871, when Professor Parkes of Netley and Professor J. Burdon Sanderson of University College, London, reported that every cellar dwelling should have at least a window and access to a water supply and sanitary conveniences. As lately as 1895 some 26,000 people were still living in cellars.

A Forgotten Classic

Dr. David Waldie, we read, was a native of Linlithgow, and obtained the diploma of the Royal College of Surgeons of Edinburgh in 1831. He practised for a time in Liverpool as a surgeon and apothecary, but, being interested in chemistry gave up medicine became chemist to the Liverpool Apothecaries' Hall, and later settled in India, where he established a chemical works in Calcutta, and died in 1889. His claim to remembrance is that he introduced (Sir) James Y. Simpson to chloroform as an anaesthetic, having already tried its effects upon himself and his friend Dr. Abraham. His paper is a classic, and has long been hidden, for it was read on November 19, 1847, at a meeting of the Literary and Philosophical Society of Liverpool.

The book ends with serviceable tables of names and dates, and there is a sufficient index. It may be looked upon as a valuable contribution to medical history, and so far as can be tested it is accurate.

D'A. P.

[1] *A Medical History of Liverpool from the Earliest Days to the Year 1920.* From the data collected by the late Thomas H. Bickerton, ChM., F.R.C.S. London: John Murray. (21s.)

A report of Mr. Walter Howarth's Semon lecture on "Some Tumours and Ulcers of the Palate and Fauces" appeared in our issue of November 14, 1936 (p. 988). The full text of the lecture, with illustrations (many of them reproduced in colour), is published in the January issue of the *Journal of Laryngology and Otology*.

Dr G McCloskey to be medical officer of health for Darwen

Dr R R H Mitchell to be senior assistant medical officer at Fife Asylum

Dr E N Reid to be medical officer of health for Stirlingshire

Dr M L Sutcliffe to be medical officer of health for Tewkesbury

Dr N B M Blackham has retired from the post of medical officer of health for Loughborough

INSURANCE MEDICAL SERVICE WEEK BY WEEK

The Principles of Prescribing

There lies before us the official memorandum on prescribing issued to insurance practitioners in Scotland We have noted on more than one occasion the fact that there is a much more economical range of prescribing in Scotland than in England and Wales and that notwithstanding this state of things the question of effecting further economies without sacrificing efficiency is constantly receiving the attention of the authorities in Scotland In the following extract from the memorandum attention is drawn to some of the matters of first importance

This memorandum has been prepared by a Joint Committee representative of (*a*) the Scottish Association of Insurance Committees (*b*) the Drug Accounts Committee (*c*) the Insurance Acts Subcommittee (Scotland) of the British Medical Association and (*d*) the Pharmaceutical Standing Committee of Scotland It is intended to serve as a guide to practitioners in prescribing for insured persons It is to be clearly understood that there is no intention to interfere with the doctor's discretion in the matter of the treatment which he may consider to be appropriate in any given case By his terms of service a practitioner is responsible for the provision of appropriate treatment and his first concern should be the best interests of his patient When drugs are required it is incumbent upon the doctor to secure that they are provided with due regard to cost Therapeutic efficiency should never be sacrificed for the sake of economy but the accumulated experience of the Central Checking Bureau Panel Committees and the Department of Health has proved that considerable savings may be effected in certain directions with no sacrifice of efficiency Practitioners are reminded that when information or advice is desired they should communicate in the first instance with the clerk to the Insurance Committee

Under the national health insurance drug tariff every individual item in a prescription is priced and there is also a dispensing fee Due regard must therefore be had to every item in a prescription the form in which it is prescribed and the quantity prescribed A reduction of one penny in the average cost of prescriptions in Scotland would mean an actual saving of approximately £12 000 per annum A detailed survey of many thousands of prescriptions representative of every area has ascertained that the causes of high costs which can be remedied are as follows

1 The use of prescriptions containing multiple ingredients of which some are (*a*) redundant by reason of their composition and/or effect—for example undue multiplication of expectorants (*b*) otherwise good and useful drugs which are employed in doses too small to be of any therapeutic value (*c*) drugs whose use is based upon tradition but which are superfluous or which *per se* are now known to have no pharmacological action—for example decoctions glycerophosphates hypophosphites etc

2 The routine employment of individual drugs and of prescriptions for certain common diseases without apparently having regard to the requirements of the individual case and the adaptation thereto of the medicament employed for example in bronchitis the routine use of expectorants of similar action

3 The use of certain proprietary [illegible] of the quasi scientific claims made [illegible] by equally pure effective and much less expensive medicaments

For example cf paraffin mollis [illegible] vaseline 2d per ounce and chalk mixture (50) 1s 6½d with kalzana tablets (50) 1s 3d

4 The all too frequent occurrence of prescriptions renewed before the previous supplies should be exhausted

5 The routine issue of prescriptions over [illegible] months often on the same day of the week

6 The routine use of certain drugs in tablet form for example acetylsalicylic acid phenacetin or Dover's powder especially in quantities of 48 96 etc

An increasing number of remedies have become available secret are now marketed with disclosure of a formula Such formulae are generally found to be unnecessarily complicated and expensive combinations of well known drugs which can be more efficiently selected and combined by the practitioner as the individual case may require

Proprietary Medicines

The *BP* and the *BPC* between them contain at least 99 per cent of all chemicals drugs and preparations used by practitioners in this country and afford uniform and reliable standards of composition and purity An increasing number of preparations resolve themselves into surprisingly simple medicaments when the practitioner realizes the true composition—for example dimethylaminophenyl dimethylaminodimethylisopyrazolone and amidophenazone are all the *BP* substance amidopyrine writ large It has been contended by some that equivalent preparations do not possess therapeutic value equal to that of the advertised proprietary articles This contention however is not substantiated by the medical profession generally

(For the guidance of practitioners there is appended to the memorandum the recognized equivalents of typical proprietary medicines The list is illustrative rather than exhaustive)

Frequency of Prescribing

The undue frequency with which prescriptions are repeated is one of the commonest causes of waste Before renewing a prescription the doctor should take care to see that the quantity already supplied has not been used up too quickly The varying domestic measures and the carelessness of some patients make perfect accuracy unattainable but the doctor might help considerably by giving advice as to how long a particular supply should last It has been found not infrequently that a supply which should have lasted five to seven days has been repeated every second or third day

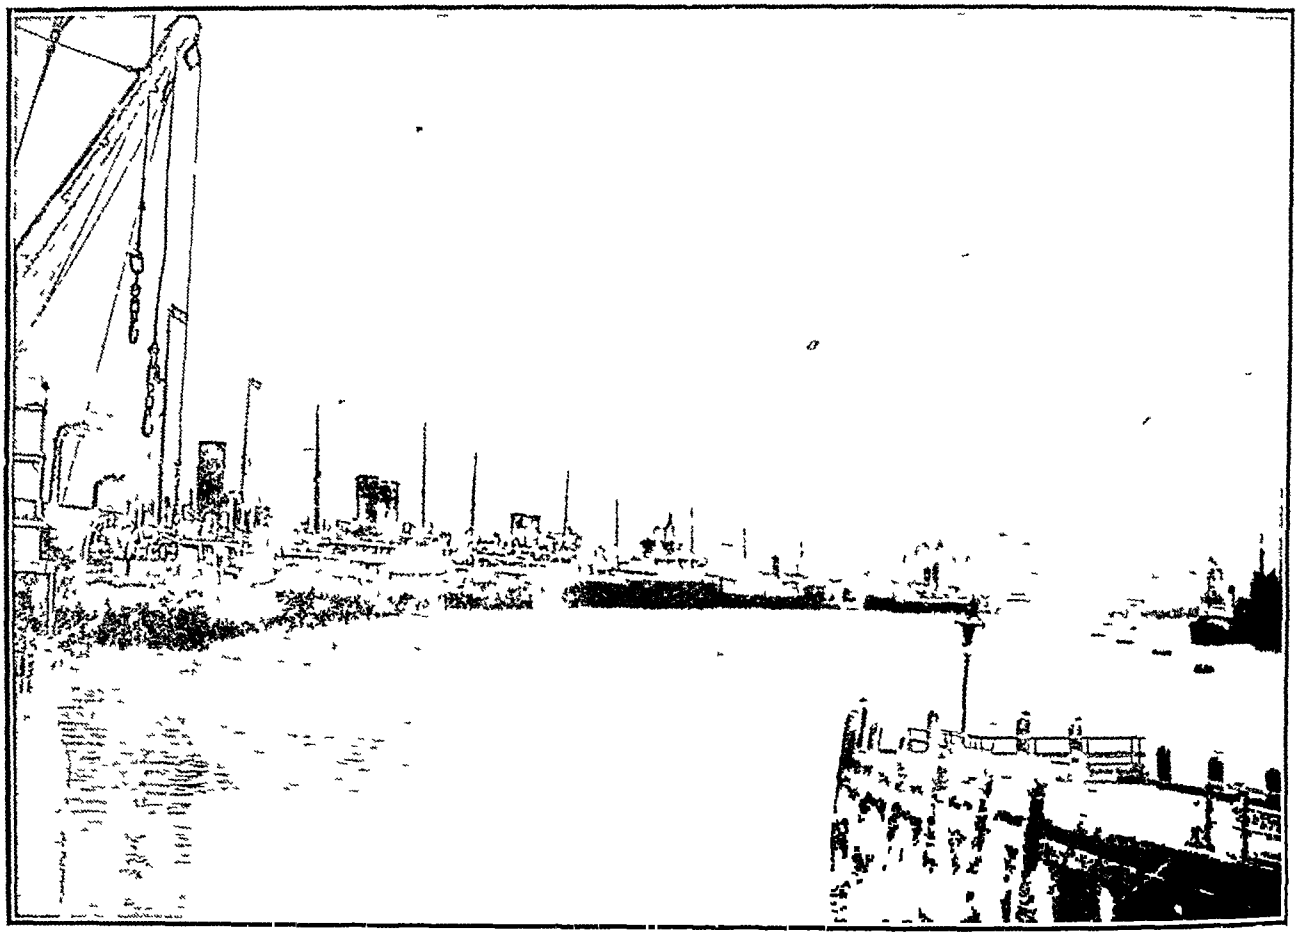

FIG 1.—Belfast Harbour. Cross Channel steamers. (*Photo Baird Belfast*)

Chichester (1603) who was given the lands of Belfast. These he accepted and retained, as he was also Governor of Carrickfergus and received a life pension of 13s. 4d. a day. It is on record that he wrote of his newly acquired lands: 'When I have them in perfection I will gladly sell the whole lands for £5 fee simple.' The rateable value of the City of Belfast to-day is just less than £3,000,000.

Determination to overcome obstacles and a shrewdness in business, combined with opportunism on the part of its citizens, account in some measure for Belfast's present industrial position. There is an absence of raw materials in the hinterland of the city, and almost all have to be imported, including flax, steel, iron, coal, tobacco, and timber. In spite of these, in part, disadvantages, shipbuilding, engineering, linen weaving, operative baking, and tobacco manufacture are all firmly established industries and are largely responsible for Belfast's position as the sixth largest port in the United Kingdom and the eighth city in the British Isles. Large areas of the city near the river are built upon silt; the harbour and docks have been excavated from the slob land at the mouth of the River Lagan. Thus it has come that a hive of industrial activity has arisen in an area which owes comparatively little to Nature but a great deal to the character of the inhabitants in making existing conditions meet the needs of the moment and anticipate the chances of the future.

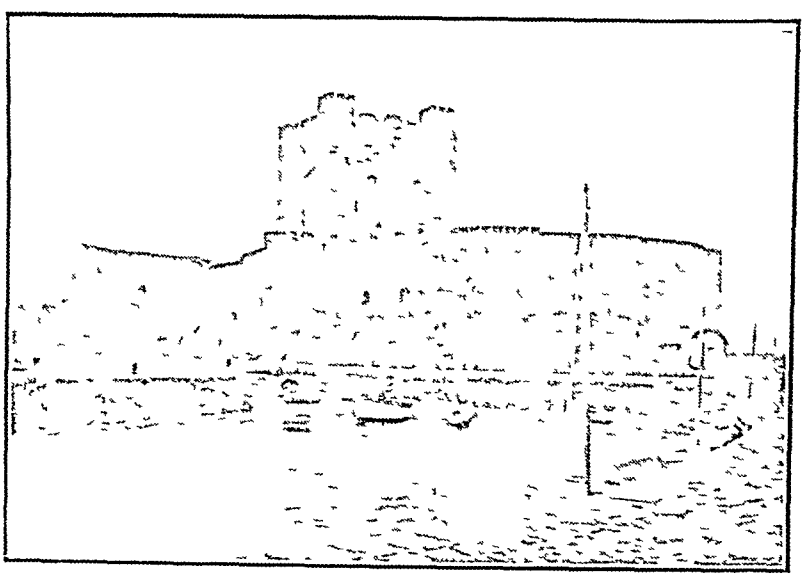

FIG 2.—Carrickfergus Castle. (*Photo Baird Belfast*)

At the restoration of the Monarchy in England in 1660 Belfast consisted of five streets and five lanes, and even when George IV ascended the Throne in 1820 the town consisted of but 2,000 houses most of which were thatched. When the British Medical Association first visited Belfast in 1884 the population was 220,000, in 1909, on the occasion of the second visit, there were 380,000 inhabitants. To-day Belfast is the capital city of Northern Ireland, the seat of Government of the Six Counties area, possesses its own Parliament buildings, Royal Courts of Justice, City Hall, Queen's University, Art Gallery, and other imposing public buildings; the city has grown to dimensions and achieved a status far in advance of anything conceived of 100 years ago. The present population is nearly half a million, and the city covers twenty-three square miles.

Scholarships and Grants in aid of Scientific Research

Scholarships

The Council of the British Medical Association is prepared to receive applications for Research Scholarships and Grants for the year 1937 as follows an Ernest Hart Memorial Scholarship of the value of £200 per annum a Walter Dixon Scholarship of the value of £200 per annum and three Research Scholarships each of the value of £150 per annum Scholarships are given to candidates who in the opinion of the Committee of the Association recommends to undertake research in any subject (including medicine) relating to the causation prevention or treatment of disease Preference will be given other things being equal to members of the medical profession The Scholarship is tenable for one year commencing on October 1 1937 A Scholar may be reappointed for not more than two additional terms A Scholar is not necessarily required to devote the whole of his or her time to the work of research but may hold a junior appointment at a university medical school, or hospital provided the duties of such appointment do not interfere with his or her work as a Scholar

Grants

The Council of the British Medical Association is also prepared to receive application for Grants for the assistance of research into the causation treatment or prevention of disease Preference will be given other things being equal to members of the medical profession and to applicants who propose as subjects of investigation problems directly related to practical medicine

Conditions of Award Applications

Applications for Scholarships and Grants must be made not later than Saturday, May 8, 1937 on the prescribed form a copy of which will be supplied on application to the Medical Secretary of the Association B M A House Tavistock Square London W C 1 Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated

Katherine Bishop Harman Prize

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize of the value of £75 in the year 1938 The purpose of the prize founded in 1926 is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child bearing It will be awarded for the best essay submitted in open competition, competitors being left free to select the work they wish to present provided this falls within the scope of the prize Any medical practitioner registered in the British Empire is eligible to compete

Should the Council of the Association decide that no essay submitted is of sufficient merit the prize will not be awarded in 1938 but will be offered again in the year next following this decision and in this event the money value of the prize on the occasion in question shall be given proportion of the accumulated income as the Council shall determine The decision of the Council will be final

Each essay must be typewritten or printed in the English language it must be distinguished by a motto and accompanied by a sealed envelope marked with the same motto and enclosing the candidate's name and address Essays must be forwarded so as to reach the Medical Secretary (to whom inquiries may be sent) B M A House Tavistock Square, London, W C 1, not later than December 31, 1937

Presbyterian clergymen of the district to carry their persecuted people across the Atlantic and to help found and inhabit the New America Three hundred years later Belfast is still associated with the transatlantic trade and is noted for the building of ocean liners which traverse the seven seas During the seventeenth and eighteenth centuries many ships were built, all of them, of course, of wood, but up till 1833 the largest vessel was the *Hindoo*, of 440 tons The pay-roll of the yard was but a score or so of hands, and the industry was all but moribund when Edward Harland was taken into Hickson's firm in 1858 Two years later Gustavus Wolff joined Harland and so was inaugurated the firm of Harland and Wolff by two young men, both of them under 30 years of age Together they built up the great reputation for first-class workmanship and design in ocean steamers which Belfast enjoys to this day In later years the firm was joined by W J Pirrie (later Viscount Pirrie), who contributed a business ability and perspicuity which stamped him as one of the foremost industrialists of his generation Ships have been supplied to many famous lines, the White Star, Union Castle, P & O, Royal Mail, Pacific Steam Navigation Co, amongst others, and during and since the war numerous Admiralty contracts have been fulfilled The pay-roll has risen from twenty-three to just under 20,000 on full employment, the company has supplied seventy-eight ships (sail and steam) to the White Star Line alone, of a tonnage of 1,300,000, in 1914 there was launched from its yard the largest output of any [illegible] in one year, 156,000 tons, in 1935 this one-fifth of the total ships built in the United Kingdom in that year Many famous ships are associated with Harland and Wolff's *Olympic*, *Titanic*, *Laurentic* (pre-war), *Georgic*, *Britannic*, *Reina del Pacifico*, *Asturias*, *Alcantara*, *Almanzora* (which is to be used for the special B M A cruise to Belfast this year), *Athlone Castle*, *Stirling Castle* of recent years During the war H M S *Glorious* and H M S *Vindictive* were built, and the new cruisers H M S *Penelope* and H M S *Belfast* have been delivered or are in the process of building

Tobacco Manufacture

Belfast is also proud of its tobacco industry, and it is worthy of note that the familiar roll tobacco so popular in industrial England and throughout the world was originally manufactured here and continues to be one of the important branches of the industry Modern habit has popularized the cigarette, and the machines in use in Messrs Gallaher's factory are the finest examples of mechanical ingenuity one can find in daily use, working with a delicacy and precision which is entrancing to watch and delightful to contemplate, and which is certain to appeal to all who are fortunate in being able to visit the works In 1850 there were fourteen small firms producing tobacco in various forms, but scientific specialization eliminated all but two (Murray's and Milligan's) In 1863 Thomas Gallaher made his appearance in Belfast from his native Derry, and he strode from success to success by virtue of his practical business mind and general ability In 1896 he acquired twelve acres of ground upon which is constructed the huge modern tobacco factory employing 3,000 hands Further extensions have been made recently and enormous bonded warehouses covering thirteen acres have been added As an indication of the commercial and manufacturing importance of the firm of Gallaher's it may be stated that they pay £5,000,000 annually in duty, and a stock of 50,000,000 lb of leaf tobacco is usually in bond

Rope Making

The rope making industry is comparatively modern, dating from 1876 when fifty employees of the Belfast Rope Works Company produced 500 tons of goods annually Now 3,000 workpeople handle the raw materials from many foreign countries, and the company exports 13,000 tons of goods annually to all parts of the world Every imaginable variety of cord and rope from finest twines to huge marine hawsers are to be seen in process of manufacture The finest fishing nets and the heavy trawls are produced in this factory, and the visitor will be fascinated to watch the elaborate ingenious machines which wind balls of string, plait ropes, and form bundles of binder twine to be used in the prairies of North America and the wheat farms of Australia and New Zealand

Other Industries

The distilling of whisky was known from early Christian times It is on record that Strongbow Earl of Pembroke, invaded the country in 1169 and found the local "usquebaugh" much more suited to the needs of the people than ale Pot stilling was the usual method of manufacture until the introduction of the Coffey still, by which a blander product resulted Since the war the demands of the Excise have extinguished the activities of most of the distilleries in Northern Ireland, but whisky drinkers still respect the names and still buy the products of Dunville's, Bushmills, and Comber

Engineering is an important industry, and there are several works which specialize in certain types of machinery These include exhaust fans, extractors, etc, many of which have been evolved to meet the needs of industries located in the area In the various processes connected with the flax yarns the factories are equipped with mammoth extractor plants to remove dust, which is deleterious to the health of the operatives, and these have been supplied to hundreds of factories throughout the world, most of whom know the famous Sirocco fan

Aerated waters manufactured in Belfast have a world-wide distribution The famous Cromac Springs not far from the city centre are especially suited for producing a high-grade commodity

It is interesting to note that felt was originally made by a medical man and that Belfast exports several thousand tons annually

This is a by no means complete account of the activities of the City of Belfast and the neighbouring counties, but it will serve to indicate the main industrial features The reader will appreciate the claim that the citizens have overcome many difficulties in establishing a prosperous community in modern times It is admitted that there is nothing "ancient" as history goes that learned scholars did not frequent antiquated inns, nor did distinguished alumni of an ancient university wander midst dark and narrow closes Belfast is a modern city of broad straight streets and new buildings, its citizens have a deep sense of public duty and are jealous to preserve its high place among the cities of the Empire Thus will they continue to exemplify the city motto—"Pro tanto quid retribuamus"

M Pirolli (*Policlinico* December 14, 1936, p 2253) states that while intestinal tuberculosis represents the most frequent complication of pulmonary tuberculosis, the estimate of its frequency ranges from 25 per cent according to clinical statistics to 50 and 90 per cent according to the pathological findings of Ganis and Kaufmann respectively There is no doubt that many cases escape recognition owing to the intestinal lesions not being accompanied by definite clinical symptoms Pirolli has recently investigated the behaviour of faecal catalase in all the cases of diarrhoea in subjects of pulmonary tuberculosis which have come under his observation, with the following result The amount of catalase is distinctly increased in all the cases of diarrhoea in pulmonary tuberculosis, while in the so called functional diarrhoea, due to other causes the increase of the enzyme is only very moderate Owing to the readiness and simplicity of the investigation, he recommends that a search for intestinal catalase should be made in all cases of tuberculosis before undertaking treatment by pneumoperitoneum

SURREY BRANCH KINGSTON ON THAMES DIVISION

A meeting of the Kingston on Thames Division was held at the Kingston and District Hospital on December 8 1936 with Dr A S HOLLINS in the chair A thick fog prevented a large attendance

Mr VINCENT O SULLIVAN demonstrated numerous clinical cases of obstetrical and gynaecological interest and there was much discussion on points of difficulty The CHAIRMAN proposed a vote of thanks to Mr O Sullivan not only for his interesting demonstration but also for his courage and perseverance in reaching the hospital at all under the difficult circumstances

SURREY BRANCH RICHMOND DIVISION

Lecture on Infant Feeding

At a meeting of the Richmond Division held at Richmond Royal Hospital on January 8 with Lieut Col E V HILGO in the chair Dr ERIC PRITCHARD delivered a British Medical Association Lecture on *Infant Feeding and Management*

Dr Pritchard explained that he only intended to single out for discussion a few special points in connexion with the feeding of infants which he considered to be of fundamental importance and in which he himself was especially interested The most important principles in connexion with the feeding of infants was to remember that the human machine like the mechanical engine required a very large number of different elements for maintenance and repair and in addition for growth also According to his estimate he thought that there were not fewer than forty such essential elements consisting of some twelve mineral substances about the same number of vitamins and in addition fuel elements—that is proteins carbohydrates and fats A good sample of breast milk contained all these elements but it was a great mistake to believe that it was always a perfect food or contained those requisites in sufficient amount Every sample of breast milk must have some defects unless the nursing mother herself subsisted on a diet which afforded all the raw materials out of which the total number of essential elements could be elaborated and secreted in the milk Breast milk was always deficient in iron and nearly always in vitamins C and B and it often contained toxins or foreign substances detrimental to the health of the infant who consumed it Complete absence in the food of any essential element always resulted sooner or later in the death of the individual who depended on it as the exclusive source of supply while insufficiency as regards quantity led to disturbances of health—that is deficiency symptoms or deficiency diseases The total number of symptom complexes or individual symptoms due to all the possible combinations of food deficiencies fairly staggered the imagination and explained why no two badly fed infants manifested exactly the same series of symptoms and when it was remembered that there were just as many excess symptoms as there were deficiency symptoms the total number of possible combinations was almost beyond calculation The disease commonly called rickets was itself a composite one consisting of innume able deficiencies and excesses It required a very considerable knowledge of dietetics to unravel the tangled skein of aetiological threads which made up this patchwork of symptoms and it was an insult to modern pathology to expect that a clinical condition which might be due to a hundred different dietetic defects could be cured by the correction of only one of them This explained the frequent failure to cure so called rickets by the administration of vitamin D The term rickets should properly be reserved for the comparatively limited number of symptoms which were directly due to a deficiency of vitamin D but should not be allowed to cover symptoms which were due to totally different faults in the diet

Dr Pritchard went on to say that artificial feeding offered many more opportunities for producing both excess and deficiency symptoms than did breast feeding chiefly owing to faulty methods of modifying cow's milk for the purpose of making it more digestible For the sake of reducing the excessive quantity of indigestible casein cow's milk was usually attenuated down to anything between 20 and 50 per cent of its original strength Unless corrections were made such dilutions caused deficiencies of every single element contained in the milk for before dilution it was in no respect too strong except as regards its casein content Although cow's milk dilutions were usually fortified with certain additions such as cream sugar and vitamin C no corrections were made for the vast preponderance of defects He had himself attempted to find some means of compensating for these serious faults in milk dilutions and had devised a special broth and vegetable broth which when [illegible] to dried [illegible] in sufficient quantity made [illegible] the feeds Broth made according to [illegible] quantities of most of the required [illegible] vitamins Some of the numerous dr[illegible] made some attempt to correct [illegible] dilutions but most of them especially [illegible] were serious offenders against the prin[illegible] feeding and without special correction that they provided were extremely [illegible] proceeded to explain the importance [illegible] infants not only as the only natural vehicle [illegible] fat soluble vitamins but as the only source [illegible] These facts were very often forgotten but apart [illegible] both living and dead and epithelial debris [illegible] solid matter in an infant's stool exceptine [illegible] lend substance to it and insoluble soaps could not [illegible] unless there was an unabsorbed residuum of fatty [illegible] splitting could unite with the calcium or magnesium present in the alimentary tract

In the further course of his lecture Dr [illegible] touched on a number of other matters which [illegible] interesting discussion at the conclusion On the motion of the CHAIRMAN a hearty vote of thanks was accorded Dr Pritchard for his address

SUSSEX BRANCH HASTINGS DIVISION

The annual dinner of the Hastings Division was held at Hastings on December 11 1936 when Dr F E DAUNT was in the chair and over one hundred medical men and their guests sat down The toast of The Hastings Division and its Chairman was given by the Rev ROSSLYN BONCE Dr DAUNT replied and paid tribute to the excellent organization of the honorary secretary Dr A H Grace and proposed his health Dr Grace suitably replied The proceedings were then interrupted in order that the company could listen to the radio speech from Windsor Castle The toast of The Visitors was proposed by Dr G NESBITT WOOD and the Mayor of Hastings Alderman BLACKMAN replied The speeches were marked by brevity and wit The company then indulged in dancing and bridge until 1 a m

WILTSHIRE BRANCH SWINDON DIVISION

A clinical meeting of the Swindon Division was held at the Swindon and North Wilts Victoria Hospital on December 2 1936 when there was a large attendance A good discussion followed the presentation of many interesting cases Mr O B PRATT showed a case of buphthalmo with dislocated lens Dr J LOWE demonstrated cases of tuberculous arthritis disseminated meningo vascular syphilis congenital pulmonary stenosis Holmes Adie syndrome and several cases of ataxia due to different conditions Mr J EWART SCHOFIELD showed cases of sarcoma of the sternum treated by radium Charcot's disease of the ankle joint bilateral aneurysm of external carotid arteries osteochondritis dissecans cervical rib and a case of recovery following ligature of anterior and posterior branches of middle meningeal artery Dr D A C IERON demonstrated a case of post encephalitis

WILTSHIRE BRANCH TROWBRIDGE DIVISION

The annual dinner of the Trowbridge Division was held at Calne on December 9 1936 when Dr J F W LEECH was in the chair and the medical officer of health for Wiltshire Dr C E Tangye was the guest of the evening The health of Dr Tangye was proposed by Dr C EDE and seconded by Dr G H H WAYLEN and Dr TANGYE replied

The dinner was followed by a lecture and cinematograph film demonstration by the courtesy of Evans Biological Institute on The Preparation and Standardization of Antitoxins and Prophylactics with Special Reference to Diphtheria The success of the demonstration was proved by the numerous questions asked the lecturer at the conclusion of his address for which he was accorded a hearty vote of thanks on the motion of the CHAIRMAN

YORKSHIRE BRANCH WAKEFIELD PONTEFRACT AND CASTLEFORD DIVISION

A meeting of the Wakefield Pontefract and Castleford Division was held at Wakefield on December 3 1936 when Dr R B RADCLIFFE was in the chair

Dr JOHN R H TOWERS (Leeds) gave an address on Some Aspects of the Heart of Middle Age Dr Towers said that

never came to hospital, and he supposed the cases sent to the medical ward were the really serious ones

No generalization should be made, Dr Schoemaker continued, as to the kind of operation to be undertaken The ruling principles were first, to keep the patient alive, and then to consider the possibility of curing him of his disease In cases of perforation, when the first necessity was to keep the patient alive, he performed a gastro-enterostomy, only in a case in which the patient was in unusually good condition was a gastrectomy done, although this was the ideal operation The same held good for haemorrhage Each case must be considered on its merits It might be better not to operate immediately, but to endeavour to stop the bleeding and stimulate the patient by blood transfusions, deferring operation until the patient was in a fairly good condition

Conservative Gastric Surgery

Gastro enterostomy had the lower rate of mortality, and therefore there were surgeons who preferred this operation in every case, but they were in the minority To gastro enterostomy there were many objections It did not take the ulcer away, nor stop the bleeding, nor prevent perforation, and it might give rise to fresh disturbances, causing peptic ulcer at the edge of the new exit, producing fistula, and perhaps bringing about always a certain amount of gastritis The mortality after gastro-enterostomy, however, in his clinic was 1 5 per cent, and after gastrectomy nearly 4 5 per cent, and the difference was even greater than these figures suggested, for among the patients on whom he had performed gastro-enterostomy were many who would not have survived the more radical operation He performed gastrectomy only when convinced that in the particular case the patient could stand it He was a conservative in stomach surgery It was necessary to bear in mind that the stomach was not only an organ of digestion, but had other functions—an antiseptic action, destroying micro-organisms in swallowed saliva, and playing a part also in haematopoiesis, and these functions should not be disturbed unless it was absolutely necessary In dealing with a patient who was weak, vomiting, or very stout so that the inflamed part of the stomach and duodenum was difficult to reach and there was stenosis, the best thing to do was to perform a simple gastro-enterostomy He claimed 60 per cent cure, 20 per cent minor degree of persistence, and 20 per cent recurrence or no relief These figures were not ideal, but he did not lose his patients after gastro enterostomy, and a living man after a gastro-enterostomy was better than a dead one after a gastrectomy

Problem of Recurrence

In dealing with recurrences it was difficult to determine whether there was a new ulcer or gastritis Examination of how the stomach was functioning would give some information on that point If the acid was very low it was likely to be gastritis If there was a new ulcer at the exit the best thing to do was to resect for the second time A very narrow duodenum was often found, and in that event it might be necessary to choose again between gastro enterostomy even on a resected stomach and gastrectomy In the case of simple stenosis he advised gastro enterostomy, in the case of haemorrhage and much pain resection In the secondary operations the cure rate was about 50 per cent If the case was one of gastritis operation was likely to give no benefit Relief was afforded perhaps for a few weeks but the condition recurred The great difficulty in operating in gastritis was that this was an inflammation with no distinct lines showing where it began or ended He believed that not more than 10 per cent of all cases need be described as incurable

SIR JAMES WALTON Mr GORDON-TAYLOR and Professor GREY TURNER joined in felicitations to the lecturer, but there was no discussion

HEREDITY VERSUS ENVIRONMENT
A FALSE ANTITHESIS?

The old biological ideas of heredity and environment which imply opposition or separateness between the two were challenged by Dr DAVID FORSYTH in an address to the Eugenics Society on January 19 As Dr Forsyth was absent on account of illness his paper was read by Dr C P BLACKER, the secretary of the society

Heredity Becomes Environment

Dr FORSYTH defined heredity as transmission from one generation to another, and environment as the conditions around an organism It was the general view—and one he had accepted—that both factors played an indispensable part in development, and that each operated separately from the other But if heredity and environment were indeed independent their origins should presumably be different, and it should be possible to trace the extent of the sphere of influence of each If it proved impracticable to recognize either apart from the other must not the value of these two concepts come under suspicion?

The view as to where heredity left off and environment began had not always been the same At the beginning of the present century the term "environmental" was applied to all that happened after birth, and what happened before birth was designated hereditary or congenital The birth process was a convenient but not a scientific line of demarcation At that time the words "ante-natal" and "post-natal" had not been coined Birth was only an incident in the life of an individual and by no means the most important, being little more than the traverse of a short tunnel in a long biological journey Once it was established that a healthy embryo might become diseased as a result of unfavourable conditions in the mother all pre-natal influences could no longer be regarded as hereditary, for clearly the maternal body or soma must be considered a part of environment The term "hereditary" was then restricted to the child and rather loosely to the womb around it, and presently to the embryo only To day the separation had been carried back earlier still Heredity was looked upon as a term applicable only to the germ cell and to what that cell comprised at the moment of fertilization of the female gamete by the male, and all the factors outside this fertilized ovum which might affect it were environmental

This position was not free from difficulty According to present views the newly formed fertilized ovum or zygote included within itself all the hereditary factors—if not in the chromosomes and genes alone at any rate in these and the germ plasm—and its environment was the womb, beyond that the maternal body, and beyond that again the outside world But the fertilized ovum had been made by the union of two sexual gametes, the female of which had remained in the maternal body To take for a moment the female line of ancestry—the same soma which in the earlier generation was the product of inherited factors exclusively became later an exclusively environmental factor, in other words, heredity became environment And on tracing the inherited constitution of the embryo forward one generation it too became environment But clearly the present distinction between heredity and environment could serve only in the case of a single generation, applied over two succeeding generations it became invalid and misleading Heredity in one generation was environment in the next

Inherited Environment

Dr Forsyth turned to the relation between heredity and environment in any one generation What had the outer world lying beyond the maternal soma, which included the zygote, to say about differentiation between inheritance and surroundings? These external elements were surely nothing but environment—air moisture, chemicals, nourishment heat, and light Nutriment of every kind was passing from the outer world through the intermediary

St James Hospital Ouseley Road S W on Wednesdays at 4 p m February 3 Dr W E Lloyd The Failing Heart February 10 Mr J G Yates Bell Prostatic Obstruction February 17 Mr Raimford Mowlem Some Common Cases Treated by Plastic Surgery February 24 Dr C E Lakin Demonstration of medical cases March 3 Mr C D Read Vaginal Discharge March 10 Dr C M Wilson Asthma March 17 Dr H Haldin Davis Common Skin Ailments

A vacation course (resident and non resident) on child psychology will be held from March 31 to April 9 at Berridge House Fortune Green Road N W 6 The course is designed to put before doctors and others the most recent findings in child psychology and to show how these can be applied in the day to day care or treatment of children Fees for the full course 5 guineas resident and 2 guineas non resident Further particulars can be obtained from the secretary Child Guidance Council Woburn House Upper Woburn Place W C 1

Infirmary was very high It was by far the commonest condition in the female medical wards, just as peptic ulcer was on the male side Most of the cases were sent to the surgeon, and highly successful thyroid surgery was being performed in Liverpool, but most of it without basal metabolic records Drs Pemberton and Goodyear were in the position of having worked for many years on the estimation of the basal metabolism, but the advent of the new machine had emphasized the drawbacks of these methods Metabolic estimations were not easily or accurately applicable under clinical conditions, however valuable they might be in research and in physiology Other clinical methods of measuring thyroid activity did not give consistent results in all cases Various formulae dependent on pulse rate and pulse pressure were too often vitiated by heart failure and hyperpiesis At the moment the value of this measurement did not seem primarily diagnostic, but rather, like the temperature and the sedimentation rate, to follow the progress of the illness It would be of great use in determining the optimum time for operation and in deciding whether pre-operative iodine was taking effect The work was so striking that under the aegis of a small committee physicians and surgeons in various hospitals should be enabled to measure their own patients and judge its value for themselves If confirmation was obtained the machine would be as useful as the electrocardiograph and be placed in every hospital

Treatment of Fractures of the Ankle

Mr NORMAN ROBERTS, in a paper on the treatment of fractures of the ankle, said that their intelligent treatment could only be based on a proper understanding of the mechanism of production Ashurst's classification into external rotation, abduction, adduction, and compression injuries was outlined and illustrated by radiographs of typical fractures He classified cases into major and minor injuries The differentiation depended on the stability of the astragalus in its socket and was made by a clinical test, in which a deliberate attempt was made to produce lateral movement of the astragalus If this manœuvre was painless it was evident that there was no danger of displacement on weight-bearing, and rigid fixation could be dispensed with In the major fractures in which actual or potential displacement existed a long period of careful fixation was necessary, ten weeks was suggested as a minimum period for any complete fracture-dislocation In the absence of direct injury to or comminution of the weight-bearing articular surface the prognosis depended entirely on the degree of success in obtaining anatomically perfect reduction In the adduction and compression injuries traumatic osteo-arthritis accounted for the frequent incidence of painful stiffness of the ankle It was largely unavoidable, and could be relieved by arthrodesis of the ankle

Mr BRYAN MCFARLAND picked out what he thought were the difficult fractures of the ankle Of recent fractures that in which both malleoli were broken at the same level as one another and at the same level as the upper surface of the astragalus presented difficulties in setting because it was so easy to move and could easily be over-reduced in any direction The best way was to feel the edges of the internal malleolar fracture with the thumb by pressing deep in the swelling The second difficult fracture was the anterior marginal, in which dorsiflexion displaced the fragment upwards and plantar flexion was apt to ride the astragalus forward on to it Of late fractures when malunion was established there were two main types First, the large posterior marginal with the astragalus articulating with the fragment which had joined the shaft in a displaced position leaving an anterior buttress This buttress could be removed and a fair range of painless movement obtained Secondly, the backward and outward dislocation of the ankle Up to a certain stage it was possible to reconstruct the fracture, but after anything like six months there was only one satisfactory procedure, and that was to arthrodese the ankle

FRANCE

[FROM OUR CORRESPONDENT IN PARIS]

Precautions Against Influenza

The Minister of Public Health issued in January a memorandum on the measures to be taken to prevent the spread of influenza to France from her neighbours The first warning concerns the avoidance of public meetings in confined spaces, the dangers of which are, it is pointed out, particularly great for the very young for the very old, and for the delicate Secondly, people are advised to remain at home and summon a doctor at the first appearance of symptoms Thirdly, cases of influenza complicated by pulmonary or other ailments should be notified to the public health authorities, although such notification is not legally compulsory The aim of this recommendation is to obtain early information about dangerous foci of disease Hospitals are also requested to send in returns as to the cases of influenza in their care It is hoped that this measure will favour isolation of the patients in hospitals for civilians

The Retiring Age for Doctors

The Conseil de la Federation Corporative des Medecins de la Région Parisienne has unanimously adopted a resolution which runs counter to the notion that doctors must retire from work at a given age (65) for the benefit of their younger brethren, if not for that of their patients, The gist of this resolution is that the age limit for professors who teach medicine should be 70 years, and in the case of those professors who are members of the Institute, 75 On the whole, the outcry in favour of the compulsory retirement of doctors at the age of 65 has not enjoyed a good press

Control of the Milk Supply

The Commission du Contrôle du Lait has issued a strongly worded report through Dr E Lesne, whose communication on the subject of control of milk supplies at a recent meeting of the Academy of Medicine was followed by a vote in which the conclusions of this report were adopted by the Academy It appears that hitherto the sanitary control of milk supplies, as exercised in most other countries, does not exist in France, where it is facultative, not obligatory The Commission finds that this facultative control has in practice achieved very limited results, and that what is urgently needed is compulsion under the combined supervision of doctors, veterinary surgeons, public health workers, chemists, and bacteriologists In the past doctors and veterinary surgeons have repeatedly issued warnings, to which legislators have turned a deaf ear The Academy is prepared to work out a complete scheme of sanitary control of the milk supply if given a mission to do so by the Government And as the present Government is more addicted to drastic action than to pious platitudes, it looks as if the prospects for reform in this field are quite hopeful

The Campaign Against Venereal Disease

As already reported in these columns (December 12, 1936, p 1222), M Henri Sellier, the Minister of Public Health, has issued the draft of a new and comprehensive law dealing with the white slave traffic, the control of prostitution, and the campaign against the venereal diseases This draft was presented to the Government on November 5 During December M Sellier issued a string of circular letters to the prefects throughout France, in which he has made it abundantly clear that though the penalties provided in his draft scheme cannot be applied until it has become law, there is

Evidence is in favour of an increase in the extracellular fluid of the body (and to a less extent even intracellular fluid) and the liver and muscles have been found to be hydrated In more severe adrenal insufficiency there is a rise in the serum potassium This appears to be a direct result of the abnormal loss of sodium, since the administration of this element will cause a fall of serum potassium to normal All these changes in mineral and water metabolism in the adrenalectomized animal can be prevented or remedied by the administration of adequate amounts of cortical extract Swingle and others found that sodium chloride and water cannot be regarded as an effective substitute for the cortical hormone in the bilaterally adrenalectomized dog since it was necessary to inject cortical extract in order to save the animals when they sooner or later developed severe symptoms Harrop and others however have kept adrenalectomized dogs alive for 150 days with mixtures of sodium chloride, bicarbonate lactate etc

The rise of blood urea and non protein nitrogen and the negative nitrogen balance that occurs after adrenalectomy are partly if not entirely secondary to the disturbance of electrolytic balance and diminished osmotic pressure since these changes tend to be abolished by the administration of sodium chloride in adequate dosage McCance produced similar changes in man as well as many features of Addison's disease by experimental salt deprivation but there was no rise in serum potassium A diet low in potassium will prolong the survival of adrenalectomized animals and conversely, a high potassium diet will precipitate death or necessitate a higher dosage of salt and/or cortical extract

That the disturbance of sodium balance is not the essential feature in all species is suggested by the observations of Silvette and Britton on the adrenalectomized marmot in which a fatal outcome was associated with the characteristic disturbance of carbohydrate metabolism but a serum sodium above normal level Jimenez-Diaz believes that the changes in mineral metabolism are secondary to the acidosis resulting from diminished ammonia formation by a poorly functioning kidney

Other Changes following Adrenalectomy

Apart from the relative polycythaemia (anhydraemia) there are other important changes in the blood picture—namely a considerable reduction in the percentage of polymorphonuclear cells as well as a diminution in the total leucocyte count Analogy with agranulocytosis has been suggested The blood pressure may be maintained at normal level until the terminal crisis but in some species a subnormal pressure characterizes more chronic adrenal insufficiency

The rise in blood urea and inorganic sulphate may be partly due to disturbed mineral balance and partly to circulatory disturbance but changes in the kidneys have also been recorded Banting and Gairns observed nephritic changes in dogs and Levy Simpson and Korenchevsky recorded tubular degeneration in rats killed during chronic adrenal insufficiency Marshall and Davis found a failure of renal function in cats before other symptoms occurred and postulated a suprarenal hormone regulating renal function The basal metabolism is usually normal until the terminal phase when there is an acute fall There may be an impairment of absorption of fat from the intestine The blood cholesterol may be raised in some species after adrenalectomy There is a hypersensitivity to foreign proteins (allergy) histamine narcotics and other drugs, toxins and bacterial infection Gonadotropic hormone may stimulate the sex organs and pituitary growth hormone may increase the deficient rate of growth but neither prolongs survival

Adrenal Glands and Infection

Elliott showed that the cortical lipoid vanishes with great rapidity in all acute febrile conditions Haemorrhage and necrosis of the adrenal cortex is characteristic of experimental infection especially with *B diphtheriae* Cortical extract combined with ascorbic acid is said to protect a guinea pig from what would otherwise be a fatal dose of a broth culture of *B diphtheriae* Caldarera found that the bactericidal power of the blood of the rabbit against several organisms is increased by cortical extract The medulla may play some part since there is an increased output of adrenaline during infection and a virulent culture of pneumococci can be rendered avirulent by treatment with adrenaline Adrenalectomized animals are susceptible to infection and toxins

Adrenals and Vitamin C

The adrenal gland has a high content of ascorbic acid (vitamin C) the cortex having about thrice and the medulla about twice the potency of fresh orange juice This vitamin is also present in large quantities in the pituitary gland and the liver Pure preparations of cortical extract potent in maintaining adrenalectomized animals do not contain vitamin C and conversely this hormone cannot prolong survival after adrenalectomy Some animal experiments suggest that the addition of vitamin C to cortical extract increases its protective action against *B diphtheriae* Hypertrophy and degeneration of the cortex results from experimental vitamin deficiency (A B and C) *In vitro* ascorbic acid inhibits the formation of melanoid pigment from adrenaline or dioxyphenylalanine

Preparation and Standardization of Cortical Extract

According to Swingle and Pfiffner the suprarenal glands (beef) packed in ice are received from the slaughter house within twenty four hours after the death of the animals, and the cortex dissected as free as possible from extraneous fat and medullary tissue ground and extracted with 95 per cent and 80 per cent ethyl alcohol for three or four days Extract with benzene Remove benzene *in vacuo* Then distribute between 70 per cent ethyl alcohol and petroleum ether Latter removed by distillation Wash concentrate *in vacuo* add water to desired volume Grollman uses a method based on the adsorption of the cortical hormone by charcoal from neutral aqueous solution Prepared in this latter way cortical extract is said to be active even when given by mouth As usually prepared however it is administered parenterally and loses the greater part of its activity if given orally

The following methods have been used for assay of cortical extract and are all based on its influence after adrenalectomy (1) survival of dogs cats or rats (2) growth rate of rats (3) response of rat gastrocnemius muscle to electrical stimulus (4) resistance to histamine or narcotic drugs and (5) maintenance of normal blood urea in dogs The dog unit is defined as the minimum daily dose of an extract per kilogram of body weight necessary to prevent an increase in blood urea after adrenalectomy No one method gives constant results and different methods are not strictly comparable Extracts are therefore usually labelled 20 grammes of cortex per 1 c cm of extract It is hoped that the isolation and synthesis of a crystalline product will be found possible and thus constitute a basis for standardization

Correspondence

The Wellcome Trust

SIR,—As the trustees appointed by the will of the late Sir Henry Wellcome we ask you to be good enough to publish this letter in order to clear up any misconception which may have arisen with regard to the effects of the will We are led to make this statement by the number of appeals for contributions to various research undertakings which have already reached us For reasons mentioned below the trustees will not be able to consider any such applications in the immediate future

In January, 1924, the Wellcome Foundation Limited was formed for the purpose of taking over the whole of the business activities of Burroughs Wellcome and Co and the various scientific research institutions and museums established by the late Sir Henry Wellcome, who held the whole of the share capital

By the terms of the will the shares of the Wellcome Foundation are now vested in us as trustees, and the activities of the Foundation throughout the world will be carried on, in collaboration with the trustees, by a board of directors, of whom the present governing director is Mr George E Pearson, who has been closely associated with the late Sir Henry Wellcome for more than forty years

It will be realized that owing to the magnitude of the testator's estate a very large sum has to be found for death duties Provision has also to be made for

(*a*) A welfare fund for the benefit of employees of the Wellcome Foundation Ltd and its associated companies,

(*b*) The payment of certain specified annuities to relatives and others personally connected with the testator,

(*c*) The erection and maintenance of a building in Minnesota to be dedicated as a memorial to the testator's parents

Subject to these prior charges the remainder of the divisible profits will be utilized in accordance with the testator's instructions in the following manner

1 For the maintenance of "The Research Undertaking Charity" which is a fund for the advancement of medical and scientific research work in any part of the world conducive to the improvement of the physical conditions of mankind, and in particular for the discovery, invention, and improvement of medicinal agents and methods for the prevention and cure of disorders, and the control or extermination of insect and other pests which afflict human beings and animal and plant life, and also for the organization equipment, and expense of special research expeditions and commissions

2 For the maintenance of "The Museum and Library Charity" which is a fund for the establishment or endowment of research museums or libraries in any part of the world and for the collection of information of every kind connected with the history of medicine, surgery, chemistry, bacteriology pharmacy and allied sciences which in the opinion of the trustees may be desirable

This statement of the position has been somewhat delayed by the fact that the testator imposed upon all his trustees the obligation, before undertaking the Trust, to enter into a covenant not to be engaged in or in any way to assist in any concern which carried on a business in competition with Burroughs Wellcome and Co Three of the trustees had no difficulty in entering into this covenant immediately after the testator's death, but the two medical and scientific trustees felt that certain words in the covenant might be held to restrict them unduly in the performance of their official and general duties to medical science and to imply their particular concern with the business interests of the Foundation The matter has now been considered by the High Court of Justice, which has made an Order allowing them to enter into a covenant in a form removing any such unacceptable implication and enabling effect to be given to what was known to have been the testator's intention

No trustee, director, or any other person holds for himself or in his own right any shares in the Wellcome Foundation, and all the divisible profits in each year will be devoted to the various purposes named in the will and indicated above

We believe this to be the first example in this country at least, of a testamentary decision by which the whole of the profits from a great manufacturing and trading organization, after certain personal and memorial bequests have been fulfilled, are permanently dedicated to the advancement of knowledge for the general benefit of mankind —We are, etc,

*** The following is the text of the proviso which, by order of the Court, may be added by a trustee to the covenant required of all the trustees under the will of Sir Henry Wellcome

> "PROVIDED that nothing in this Covenant shall be held to prevent me in the exercise of my proper function in any appointment held by me in the public service or under any publicly or privately endowed organization for the promotion of medical research or under any University in Great Britain from giving advice on scientific matters to any person or persons solely for the purpose of rendering scientific discovery available for the general use and without pecuniary reward or other personal advantage to myself'

Cancer of the Breast

SIR,—The lecture by Mr Cecil Rowntree printed in your issue of January 23 (p 153) on cancer of the breast is full of interest, and consequently of points for discussion One of these seems to me to call for particular comment Under the heading "Results of the Operation" Mr Rowntree refers to statistics showing that less than half the patients operated upon for cancer of the breast in its earliest stage (Class I of the statisticians) are free from any signs of disease at the end of five years, and that the figure drops to "something like 20 per cent" when the axillary glands have been invaded (Class II) At the end of the paragraph he says that in a later stage still (presumably Class III) "the survival rate drops almost to nothing"

I do not know, however, of any extensive statistical survey where the incidence of recurrence has been taken into account On the other hand, there is much evidence to show that the *survival rate* following the best surgery is much better than the gloomy figures quoted by Mr Rowntree It is not clear, however, whether his remarks refer to survival rate or to survival without recurrence

This uncertainty necessitates reference also to Mr Rowntree's remarks on the use of radium He mentions my work in this connexion, and gives the impression that the use of radium has been found unsatisfactory and is being gradually abandoned Presumably, therefore, the

ONE HUNDRED AND FIFTH ANNUAL MEETING
OF THE

BRITISH MEDICAL ASSOCIATION

BELFAST, 1937

THE one hundred and fifth Annual Meeting of the British Medical Association will be held in Belfast next summer under the Presidency of Professor R J Johnstone BA MB FRCS FCOG MP consulting surgeon Royal Maternity Hospital gynaecologist to the Royal Victoria Hospital and professor of gynaecology Queen's University Belfast he will deliver his address to the Association on the evening of Tuesday July 20 The Sectional Meetings for scientific and clinical work will be held on Wednesday Thursday and Friday July 21 22 and 23 the morning sessions being given up to discussions and the reading of papers The Annual Representative Meeting for the transaction of medico political business will begin on the previous Friday July 16 The names of the seventeen Scientific Sections and their Presidents were printed in the *Supplement* of December 19 1936 The full list of officers of Sections the provisional programme and time table list of hotels etc and other details of the arrangements for the Annual Meeting will appear in later issues We publish below the first of a series of articles on the City of Belfast and its University and medical institutions

BELFAST—THE GATEWAY TO ULSTER

It was at Saul near Downpatrick, that Saint Patrick first landed in Ireland (A D 432), John de Courcy came with an English army in 1171 and was created Earl of Ulster by Henry II King John visited Ulster in 1210 and in 1315 Edward Bruce invaded the country and was followed by his brother King Robert Bruce and they almost destroyed the Anglo Norman colony in Ulster William III took Ulster as his base to drive James II out of Ireland For these invaders Carrickfergus on the Antrim shore of Belfast Lough was then the usual landing place and Carrickfergus Castle the fortress of importance

To day the gateway to Ulster is through the modern city of Belfast Few cities have so attractive an approach as the voyage up Belfast Lough presents particularly in the early morning The cross channel steamer after passing the towns and villages along the coast of Down swings round at the Copeland Islands and enters Belfast Lough with the shore of Down on the port side and that of Antrim on the starboard a distance of seven miles separating them The coast lines are different but each is typical of its county—Down of the gentle grassy slopes Antrim rugged volcanic and austere As the steamer passes along this impressive waterway leaving Bangor Holywood, Whitehead and Carrickfergus behind the lough narrows the shipyards come in sight and the outlines of the city take shape There is an atmosphere of shelter and seclusion about this approach to an industrial city, somewhat suggestive of the safe anchorage so widely known to be provided to ships by Belfast Lough Presently speed is reduced the steamer gently glides alongside Donegal Quay and the visitor is free to set foot in a country full of distinctive charm famous for its wealth of natural beauty and noted for the traditional hospitality of its people

The People of Ulster

The people of Ulster are in many respects unique They have an individual character the result of the different strains which have been added to the original stock at various periods of history To the basic Irish temperament has been added the blood of the Normans in the twelfth century and in even earlier legendary times there was much intercourse with Scotland whereby Northern Ireland and Scotland easily exchanged inhabitants Elizabeth settled West countrymen here and James I in the Plantation of Ulster after the flight of the Earls gave their confiscated lands to settlers who came mainly from the Scottish lowlands The order of baronets was instituted by James and admission to this hereditary order of knighthood was paid for in hard cash the sums thus accumulated being earmarked for the expenses of the plantation Every baronet, whether of old or recent creation still bears in his coat of arms the Red Hand of Ulster The Revocation of the Edict of Nantes in 1685 drove half a million Huguenots out of France, and many thousands of them settled in and around Belfast Their descendants are to be found here to this day so that the modern Ulsterman is a mixture of many bloods—Celtic Norman Scotch French and English—and the variables in character sometimes make an attractive individual, always an industrious member of the community and at the same time a distinct type independent sturdy pushful, and above all determined Many tributes have been paid to the Ulster character by kings statesmen publicists and politicians but the late Lord Rosebery's is most often quoted I love Highlanders I love Lowlanders but when I come to the branch of our race which has been grafted on to the Ulster stem I take off my hat with veneration and with awe They are I believe without exception the most irresistible race that exists in the universe at this moment

Much of the art and craft of settlers still persists throughout the country and their speech manners and names the fine work of the linen workers is the heritage of the Huguenots and many of the old French names have survived the speech of Elizabeth and of Shakespeare is in ordinary use in the country districts and much of the Ulster dialect and pronunciation and use of words is but a retention of the Elizabethan speech Names such as Crommelin and de Lacherois are still to be found in the directories and words such as servant steal and gold have still the Elizabethan pronunciation of sarvint stale and goold in the country

The Capital City

So the visitor arrives in Belfast the capital city of Northern Ireland A glance at a map shows that it is situated in the natural junction of the necessary communications between the counties of Antrim and Down with an excellent outlet to the sea but Belfast is essentially a product of modern industrialism during the last 150 to 200 years Carrickfergus ten miles from Belfast on the Antrim shore of Belfast Lough (which used to be called Carrickfergus Bay) was for centuries the important community of North East Ulster Carrickfergus is noted for its castle built by John de Courcy in 1171 the square keep being a prominent landmark for miles around This is a very perfect example of the Norman type of military stronghold and is one of the noblest examples of that time extant in Ireland When Carrickfergus was at its zenith Belfast was but a village of a few houses at the ford of the river (bel town fearst, ford— the town of the ford) After the flight of the Earls came the English and Scottish settlers among them a Devonian Arthur

produced by individuals carrying out the perurethral method exclusively, but on the grounds of logic and common sense I feel strongly that while large adenomatous prostates can be and are treated by the perurethral method, it is by no means the best way of dealing with them

Finally, with regard to Mr Loughnane's dislike of prolonged drainage of the bladder by the in-dwelling catheter, I am aware of the difficulties of carrying this out, but by means of a technique designed to avoid complications this method can be successfully used for months at a time if necessary I am sure Mr Loughnane would agree that even a suprapubic de Pezzer catheter can cause sufficient fibrosis to render subsequent suprapubic prostatectomy a less satisfactory operation both as regards exposure and re-trigonization of the prostatic bed than if performed as a primary procedure—I am, etc,

Liverpool, Jan 18 J COSBIE ROSS

Angioneurotic Oedema

SIR—I was interested in the case of angioneurotic oedema recorded by Dr David R Hughes in the *Journal* of January 16 (p 121) because of the presence of albumin and pus in the urine Since the association of urticaria with a urinary infection was forcibly brought to my notice in the case of a doctor some years ago, I have looked for such an infection in all cases of urticaria and angioneurotic oedema where there has been no obvious cause, and I have been amazed at the frequency with which a *B coli* or other infection of the urine has been found, even though previously quite unsuspected

The connexion between the two conditions has been proved in many such cases by the disappearance of the urticarial attacks after the urinary infection has been cured—I am, etc,

Sheffield Jan 20 ROBERT PLATT, M D, F R C P

Inhalational Therapy

SIR,—Your leading article in the *Journal* of January 23 (p 175) is indeed timely Inhalational methods of medication in diseases of the respiratory tract, and, still more important, the wider methods of physical medicine, including chest remedial exercises in such diseases, have been a sadly neglected chapter in medicine In the inhalation department at the St John Clinic and Institute of Physical Medicine (under the jurisdiction of the Order of St John of Jerusalem), the only department of its kind in this country, we have observed remarkable results in many chronic respiratory disorders, including asthmatic subjects who have failed to respond to the usual methods of drug therapy alone Moreover, it is not without interest that through the influence of the British Health Resorts Association certain British spas, which are beginning to specialize in these chronic respiratory disorders, are taking up this important branch of medicine, and one of these spas is actually engaged in the construction of an inhalatorium run on similar lines to that at the St John Clinic

Countless numbers of asthmatic subjects and those suffering from chronic respiratory diseases who have had prolonged treatment without appreciable benefit come to the inhalation department from all parts of the country, and experience great benefit from this treatment in conjunction with other physical methods

Let us, however, not abuse a valuable form of treatment and run the risk of getting it into disrepute by making claims for it which it can never endure In asthma, for example the environmental, psychological, dietetic, medicinal and other factors all have their part to play, and if these are minimized at the expense of making claims for a form of treatment which has hitherto been neglected, that attitude, apart from being unscientific, serves no other purpose than to bring the type of treatment in question into disrepute, which would be unfortunate—I am, etc,

St John Clinic and Institute of Physical Medicine, Jan 22 PHILIP ELLMAN

Glycosuria

SIR,—Before drawing conclusions as to the significance of glycosuria from the case he describes in your issue of January 23 (p 194) Dr Anderson should first be sure that it was glucose and not lactose which he found in his patient's urine, this is not clear from his description

It has, of course, long been recognized that lactosuria is comparatively common among nursing mothers, particularly, I imagine, in a case such as this, when the breasts are distended, but this does not necessarily indicate any metabolic disturbance—I am, etc,

London, S W 20, Jan 24 S VATCHER, M D

Blood Transfusion

SIR,—In his letter in the *Journal* of January 2 (p 40) Dr R Vaughan Facey raised the question of the possible danger of repeated blood transfusion from the same donor I was unfortunate enough to experience an untoward result in such a case The clinical notes not being at present available to me I write from memory

The patient was a woman aged 30, suffering from aplastic anaemia (possibly of specific type as there was a comparatively recent history of luetic infection, and despite active treatment the Wassermann and Kahn reactions were positive) The anaemia, which was extremely severe, was accompanied by haemorrhagic symptoms—bleeding from the gums, purpura and retinal haemorrhages, and profuse and prolonged menstrual flow No form of treatment other than blood transfusion was found to produce any improvement

Two days after admission to Paddington L C C Hospital the patient received her first transfusion from the donor in question He was a friend, not related to the patient, and was of the same blood group (Group II Moss) In addition a direct matching test revealed no agglutination This transfusion, approximately 600 c cm of citrated blood being given, produced no untoward effects, and an immediate improvement was noted in both blood picture and haemorrhagic symptoms

Further transfusions were given at intervals of a few days until a haemoglobin level of about 75 per cent was reached This was maintained so long as transfusion was repeated at intervals of not more than about ten days A different donor was employed on each occasion, and none of the transfusions caused any undesirable symptoms

Approximately eight weeks after the first transfusion the same donor was employed again No direct matching test was done on this occasion After receiving 200 to 300 c cm the patient became pale and complained of faintness Shortly after this she vomited and the pulse became rapid and feeble There was no dyspnoea The infusion was stopped when somewhat less than 400 c cm had been given The patient continued to vomit at intervals during the next twelve hours and complained of severe headache and general weakness The most striking feature, however, was a return of the haemorrhagic symptoms the gums began to bleed again, and a menstrual period, which had ceased shortly before the transfusion, recommenced, the loss being extremely profuse In the course of a day or two the haemoglobin fell to the level of about 30 per cent and the patient's general condition, previously very good, became critical

Further transfusions were given at shorter intervals, and eventually the patient began to improve again, though uterine haemorrhage continued for over two weeks One subsequent transfusion produced a transient, generalized, urticarial erup

The Linen Industry

The linen industry has for long been one of the staple trades of Ulster but authentic history as to its origin is not easily obtainable It was probably not of much importance until encouraged by the Norman settlers but it is known that Walter de Burgo Earl of Ulster (1264) had linen for his household use which was woven in Newtownards Co Down The credit of the art and craft of fine linen manufacture however must be given to the Huguenots who fled from France after the Revocation of the Edict of Nantes (1685) as they introduced the spinning wheel and their finer methods of working had a far reaching influence upon linen manufacture Ulster's supremacy in fine linen work remains to this day and has enabled the industry to maintain itself in the past against the jealousy of the English woollen manufacturer, the mechanization of cotton looms, and the handicap to day of high tariff barriers in foreign countries Early manufacture was entirely by hand looms and various villages throughout the countryside formed communities of industrious craftsmen and women

With the introduction of steam power a revolution occurred and the first spinning mill worked by steam was built in 1828 by James Murland at Annesborough, Co Down in 1830 Messrs Mulholland set up 1,000 spindles in Francis Street Belfast and shortly afterwards a further 8 000 in York Street Belfast This last enterprise developed into the York Street Flax Spinning and Weaving Company Ltd, which now has 57,150 spindles at work and carries on all the operations incidental to the production of linen on a huge scale

The outbreak of the American Civil War interfered with the supplies of cotton throughout the world householders had to use linen and this resulted in a boom in the trade with the consolidation of the position of Belfast as the centre of the linen industry To day Northern Ireland is the seat of a highly organized industry dealing with flax in all its stages from its retting scutching spinning and weaving and when the trade is working full capacity it employs upwards of 90 000 workers Only a small proportion of the flax used is grown in Ireland because the cultivation of the crop makes a very severe drain upon the riches of the soil but intensive research is being continuously carried on by a Government department to improve the yield of flax and make it a profitable crop His late Majesty King George V was much interested in this development and grew flax on his Sandringham estates from seed specially produced in the Northern Ireland Research Institute which was eventually woven into fine linen in Belfast

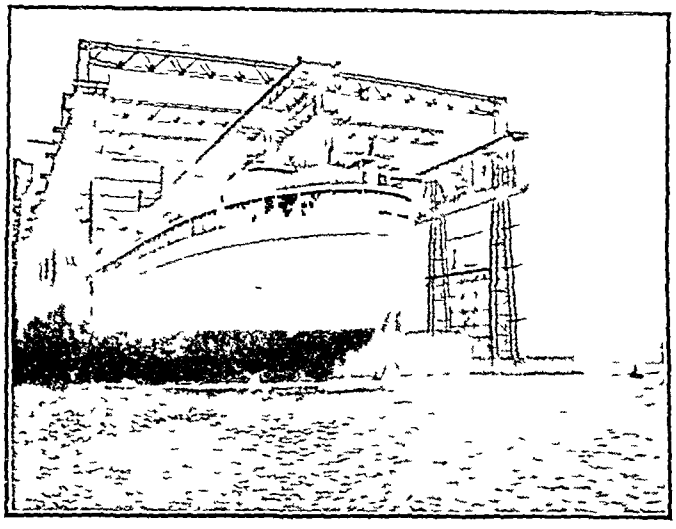

FIG 3—Launch of *Athlone Castle* Messrs Harland and Wolffs (*Photo Baird Belfast*)

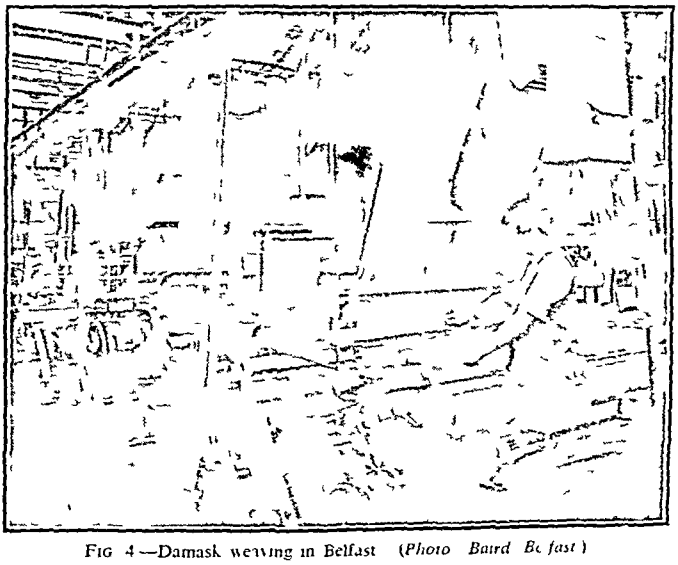

FIG 4—Damask weaving in Belfast (*Photo Baird Belfast*)

Fields of ripening flax will be seen in July looking like half grown corn but with a delicate blue flower The crop is pulled by hand (a laborious job) tied into bundles and retted in pools of still water for some days to allow the woody fibre to rot The bundles of flax are then removed and spread out to dry the flax water indicating its presence by a peculiar smell which when once recognized will not soon be forgotten The dried fibre is then taken to a scutch mill where it is subjected to a process of rough combing whereby the woody matter is removed and the flax fibre is saved This is spun into yarn in the spinning mill and passed on to the weaving factories where the beautiful products are woven into long strips of natural linen For household use the linen is bleached by sunlight in the fields —a process which demands a moist atmosphere this combination of sunshine and shower is a feature of the Ulster climate and makes it peculiarly fitted for the process None of the chemical bleaching processes can approach in their results the softness whiteness and durability of the naturally bleached fabric which is justly world famous and is universally admired and desired The natural unbleached linen finds a field of usefulness in the demands of aircraft manufacturers and during the great war the bulk of the linen used by the Allied Air Forces was produced in the factories of Northern Ireland

Shipbuilding

The history of Belfast shipbuilding starts in 1626 when the *Eagle's Wing* a vessel of 150 tons, was built for

Injection Treatment of Hernia

SIR,—The current literature on this subject, while mentioning the old, bad, unsafe methods of pre-aseptic days, does not sufficiently stress the distinction between these and the modern methods which have evolved from the last twenty years of research Originally solutions were employed which were decidedly irritating if not dangerous, such as iodine, cantharidis, turpentine, etc, and these, injected with no aseptic precautions, led inevitably to results which brought the treatment into disrepute, and this, coinciding with the advent of general anaesthetics and consequent operative procedure, caused further work on the subject to be abandoned

Recently a great deal of fresh work has been done on the subject Experiments on guinea-pigs, dogs, and monkeys have shown that with the use of mildly irritating small injections into the fascia of tannate and gallate solutions of different plant principles within a few hours there is a definite reaction largely manifested by oedema of the tissues and the production of fibroblasts, which appear later as young fibrous tissue cells At the end of two weeks the cells appear well developed, and for each injection there is a small area of firm fibrous tissue

Pina Mestre, who first described this treatment for hernia in 1927, has used it in more than 10,000 cases Almost without exception the procedure closed the canal, and eradicated the hernia, in from ten to fifteen injections

In certain cases, such as irreducible hernia, the radical operation is the only possible treatment, but where operation is contraindicated—as in old age and heart or lung disease—or when operation has failed, then the injection treatment provides a safe and satisfactory alternative

In the operation for radical cure tissues are divided, muscles anchored in situations foreign to them, and possibly weak and flabby muscles united The injection treatment is not open to any of these objections, and it not only closes the aperture but reinforces and strengthens the muscles bounding it Theoretically, then, the injection treatment compares favourably with the operation Its other advantages are undeniable (1) It can be used at any age (2) It is entirely ambulatory (3) The patient is not required to stop work (4) No hospital or nursing home expenses (5) If not completely satisfactory a few further injections will reinforce the barrier already laid down

In the last eighteen months I have used this treatment successfully in cases of indirect inguinal hernia, direct inguinal hernia, and recurrent hernia after operation, and have been most impressed by the remarkable response in cases of recurrent hernia In one instance five injections sufficed to repair the damage It would appear that the tissues, which have already been subjected to trauma and have made feeble and ineffectual attempts at repair, react more strongly to the stimulus of the proliferating fluid than those where no such attempt has been made

It is obviously necessary that the hernia should not be allowed to protrude once the treatment has been started, and certain writers have insisted on the necessity of wearing a strong steel spring truss during the day and allowing a webbing appliance at night This has obvious disadvantages, as it entails the removal of the truss by the patient twice daily Recently an appliance has been devised in America which has met with the approval of the exponents of the treatment there This is stiffer than the usual webbing appliance, and is capable of retaining the hernia during the day and can still be worn with comfort at night This enables the patient to wear it continuously during the treatment, it being removed only to give the injection I have used the appliance in this country, and find that it satisfactorily fulfils its purpose

From my own experience of the injection treatment I think that it is all that is claimed for it, but is specially valuable where operation has failed—I am, etc,

London, W 1, Jan 20 E W ARCHER

Modes of Administering Thyroid Substance

SIR,—Dr H Gardiner-Hill asserts (*Journal*, January 16, p 133) that when thyroid substance is administered in acute infections such as tonsillitis and influenza, thyro toxaemia is liable to develop This alarming statement has interested me very much because, although I have *prescribed thyroid very frequently* in the past fourteen years for many acute infections, including influenza and pneumonia, but not tonsillitis, not once have I seen this serious condition arise This discrepancy in experiences may be due perhaps to the technique I use, as it differs slightly from Dr Gardiner-Hill's, for whereas he orders thyroid in the usual tablet form and manner, my practice has been never to order it for an acute infection without combining it with a fractional dose of potassium permanganate, which is given by the mouth or bowel, according to the type of case This is a method I have learnt to respect, partly from personal observations, but chiefly through reading or listening to what other observers have had to say on the subject after using the same technique as myself

For example some seven years ago I read a report in this connexion which so convinced me that this combination method might have unexpected advantages over the older method that I have continued to study and use this newer therapy ever since It ran as follows

> 'During the last two years in Cairo sixty-nine cases were diagnosed pneumonia, sixty-four of these were treated with potassium permanganate and thyroid with four deaths, in five cases not so treated there were three deaths It is stated that the patients differ noticeably from those not so treated, the tongue is cleaner, food is taken better, and there is less toxaemia"

This passage is taken from the Report on the Health of the Army for the year 1928, vol 64, p 31—I am, etc,

Guildford, Jan 20 HERBERT W NOTT

Atypical Anthrax

SIR,—I was interested to read in the *Journal* of January 9 (p 73) of an unusual case of anthrax, described by Dr A E Hodgson, as it was my lot to encounter a case of anthrax which, although it did not present similar features, may be of interest to your readers on account of the absence of a typical cutaneous lesion Unfortunately the condition was undiagnosed and had a fatal issue

A labourer on a sewage farm was admitted to hospital with a history that a week before admission while loading manure he received a puncture wound on the dorsum of the fourth web of the right hand from a fellow worker's digging fork The wound bled a little and did not attract any further attention until the day before admission to hospital, when painless swelling of the whole hand was noticed

On admission the patient, aged 29 years, was found to be a powerful and healthy adult whose only complaint was the swelling of his right hand, the temperature was 99° F, pulse rate 90 per minute His general condition was excellent On the dorsum of the right hand between the heads of the fourth and fifth metacarpals was a healed puncture wound, which was not even tender The outstanding feature, however, was the massive oedema of the dorsum of the entire hand, and there was also some bulging on the palmar aspect On the dorsum the oedema was so gross as to give the im

Reports of Societies

INDIVIDUAL PSYCHOLOGY

At the annual dinner of the Medical Society of Individual Psychology on January 14, the chairman Dr C M BEVAN BROWN, presiding Dr J D REES director of the Institute of Medical Psychology, congratulated the society on the work it was doing to make psychological principles and methods intelligible not only to general medical practitioners but to lawyers, clergy, and others whose work depended for its efficiency on an understanding of psychology Dr BEVAN BROWN said that those responsible for the work of the society recognized the need for simplification, at any rate, in relation to the groups referred to Psychology touched all branches of medicine It was difficult to evangelize the ordinary doctor, whose daily tasks involved a highly critical faculty which made him perhaps unduly sceptical of novelty, but the real fault was in the inadequate teaching of psychology during his training

Mr CLAUD MULLINS, metropolitan police magistrate said that although without detailed knowledge of medical psychology he could testify as to its value So far he had never had anyone back before him for a second offence who had received psychotherapeutic treatment He asked medical psychologists to recognize certain essentials if their work was to be recognized The law received no scientific medical or psychological training it was necessary therefore, that the reports on such matters to which they were asked to give attention should be presented in terms of clarity, simplicity and common sense Mr Mullins also referred to the need for an alteration in routine procedure in the courts in dealing with a child, the victim of assault, who was required to give evidence in public He thought that such evidence should be heard privately, though the jury should be present and the Press should not be excluded

THE HOSPITAL STATISTICIAN

Two hospital statisticians Mr B E SPEAR and Mr C E GOULD gave to the Section of Epidemiology of the Royal Society of Medicine on January 22 some account of mechanical tabulation as carried out with hospital case records

They described in particular the system adopted by the London County Council in regard to its general hospitals since 1930 and its special hospitals since 1931 By a system of coding and of punching with some rather complicated machinery it is possible to set out in a very small space on a single card a vast amount of information relating to a patient The card has self-coding panels for age, marital condition, occupation, condition as to insurance, date of admission and discharge reason for discharge, condition on leaving, and much other information There are special cards for maternity cases, children, tuberculosis, the ambulance service and other purposes The special coding arrangements for indicating diseases are of a very complicated order Diseases are divided into thirteen main groups, with up to twenty four subdivisions in each group It was stated that nearly 300 000 cards are turned out annually by the London county hospitals The work of summarizing them is a very detailed and elaborate affair but the whole value of the machinery lies of course, in its practically unlimited scope for analysis The application of mechanical tabulation said Mr Spear placed a powerful aid in the hands of the investigator, and County Hall was supplied every year with a complete index of the principal diseases and complications treated in the hospitals controlled by the Council The purposes served by the tabulation unit included annual returns to the Ministry of Health as to hospital patients and their costs, the Council's own annual returns for the hospital services the ambulance statistics (there is a card for every street accident) quinquennial tables and special investigations Mr Spear urged that it was unreasonable to suppose that the same person was likely to be an expert in medicine and in statistics Medical training was directed to observation while the statistician had nothing to do with observation but with analysis It might even be said that a good doctor was necessarily a bad statistician Statistical investigation should precede and dictate policy

General Discussion

Surgeon Captain S F DUDLEY who presided said that while he appreciated mechanical tabulation he thought the statistician must also realize that the collection of data was the great weakness The same case for example might be described by different medical men as one of influenza, tonsillitis, or pharyngitis Therefore the statistician either himself needed to know a certain amount of medicine or else to be coached by a common sense medical officer who was keenly aware of his own mistakes Dr W A DALEY said that devices for mechanical tabulation were not new in the public health service He remembered the system fifteen years ago at the tuberculosis dispensary in Birmingham He believed the Glasgow Corporation was the next to take it up, and there it was used not only by medical officers but by sanitary inspectors London and Manchester then came into the field, and Liverpool followed He deprecated the practice of some Government departments of telling local authorities about November or December that they required a certain slight alteration in the statistical returns for the year then about to close Fourteen or fifteen months notice should be given before any alteration was made in a basic statistical table He also pointed out that it was important that a doctor before starting on a statistical research should consult an expert statistician instead of asking the statistician to approve his tables after he had been working on them for many months, for it was quite likely that he had made a wrong assumption at the start Equally when a statistician was about to undertake a research of his own he should consult a doctor because the statistician was rather apt to regard a statement on a card as a definite and indisputable fact He looked forward to the time when cards filled up after the manner now prevailing in the county hospitals would be available in respect of all patients in the voluntary hospitals and private nursing homes of London Dr LETITIA FAIRFIELD pointed out that the value of the statistical tables was no higher than the amount of knowledge and accuracy which went to the registration of each item

An exhibit of the cards and tabulators was on view at the meeting On an average each card bore thirty five punch holes

SURGERY OF GASTRO DUODENAL INFLAMMATION

Dr J SCHOEMAKER of The Hague delivered a lecture before the Hunterian Society at a meeting at the Mansion House London, on January 18 with Mr H L ATTWATER presiding

Remarking that he had supposed the Hunterian Society to be exclusively composed of surgeons Dr Schoemaker devoted himself entirely to the discussion of the surgical treatment of ulcers of the stomach and duodenum and showed a long cinematograph film illustrating the technique of operation The indications for operation he said lay rather in the territory of the physician than of the surgeon Everyone knew that an ulcer could be cured by medical treatment and an attempt must first be made to bring about healing in that way As soon as medical treatment proved unsuccessful it was the duty of the physician to send his patient to the surgeon How many cases were cured independently of surgical aid he did now know because surgeons did not see the patients who

The Council elected five committees in India (*a*) for the Provinces of Bengal, Assam, and Orissa, (*b*) for the Bombay Presidency, (*c*) for the Madras Presidency, Mysore, Travancore, and Hyderabad, (*d*) for the United and Central Provinces, and Bihar, (*e*) for the Punjab, North-West Frontier Province, and Sind The function of these committees will be to consider any matter bearing upon obstetrics and gynaecology in their respective areas, and to report to the Council of the College

Authority was given to submit a loyal address to His Majesty King George VI

Obituary

THOMAS GOODALL NASMYTH, M D, D Sc

F R C P Ed, F R C S Ed

Late Medical Officer of Health for Fife

The death took place on January 16 at his home in Edinburgh of Dr Thomas Goodall Nasmyth, who for many years had been well known in public affairs of Edinburgh and Fife He was born in 1856 at Auchterderran, Fife, and after a medical course at Edinburgh graduated M B, C M in 1876 After some years in practice he was appointed medical officer of health for Fife, Kinross, and Clackmannan, being the first medical officer to be appointed for this district under the Local Government (Scotland) Act of 1889 He had already taken the D P H of Cambridge in 1886, and the D Sc (Public Health) of Edinburgh in 1887 Later he joined the Royal College of Surgeons of Edinburgh as a Fellow in 1910, and became a Fellow of the Royal College of Physicians of Edinburgh in 1913 As medical officer of health he resided in Cupar, and his work was largely connected with the health of the mining community in the county of Fife He was a pioneer in many matters affecting public health, such as urging the formation of regional water schemes, and his work was greatly appreciated by the county council and the community which he served During the war he acted as administrative medical officer for H M Munition Factory at Gretna He held many appointments, both during his period of activity in Fife and after his retirement, when he lived in Edinburgh He was, for example, a director of the Fife Coal Company, of the Commercial Bank of Scotland, of the Highland and Agricultural Society, and of the Scottish National Housing Company Limited He took a great interest also in medical affairs, and at the time of his death he was chairman of the Royal Maternity and Simpson Memorial Hospital, convener of the Medical Committee of the Deaconess Hospital Board a member of the board of the Royal (Dick) Veterinary College and of the board of the Animal Diseases Research Association of Scotland, and president of the Scottish Branch of the Society of Medical Officers of Health He also acted as a member of various consultative committees of the Scottish Department of Health He was frequently called as a witness to give evidence before various public committees and commissions and made valuable suggestions before committees of the House of Commons on such subjects as the miners' eight hours day diseases in the mining industry, and certification of death

Dr Nasmyth after his retirement from the post of medical officer of health in Fife served from 1921 to 1929 on the Edinburgh Town Council representing Morningside Ward where he resided His wide experience of business and public health subjects rendered his advice particularly valuable in connexion with housing and other matters dealing with the welfare of the community, and his judgement carried great weight among his municipal colleagues Dr Nasmyth first joined the British Medical Association in 1888 He served on the Central Council from 1906 to 1910, and acted as representative when the Association met at Belfast in 1909 and again at Birmingham in 1911 He was a man of great physical and intellectual activity, taking a keen interest in the modern development of medical science He found time to publish *A Manual of Public Health* He also contributed frequently to current medical literature on subjects dealing with public health questions, such as "The Geographical Distribution of Cancer in Scotland," "Sewage Purification," "Milk-borne Diseases," and "Air of Coal Mines" He was a keen sportsman, his interests in this direction including hunting and later shooting, fishing, and curling He was a deputy lieutenant for the city of Edinburgh and a justice of the peace for the county of Fife

Dr C E DOUGLAS sends the following appreciation

By the death of Dr T G Nasmyth there has passed one of the strongest personalities, a man of the widest capabilities and sympathies, in the profession of medicine He returned to Fife, after local schooling here and medical training in Edinburgh, and took up practice in the mining district where his father had created the Fife Coal Company A splendidly built young man, taking to hunting and fishing along with the rough and-tumble work of mining practice of those days, he seemed to fill the niche quite perfectly But he was made of other stuff Not so much the treatment of accident and disease but their prevention became more and more his aim Research on the condition of mines took up much of his attention in particular his study of the air conditions of coal mines was one of the earliest researches on that subject In those days, when the B M A was but a small power in Scotland, there existed a Fife Medical Association In this Nasmyth took a lively interest, and in the early 'eighties a petition came up to the then ruling Government from the F M A praying for the creation by law of the office of a "medical officer of health," which should be a permanent appointment In due course of time this idea was made law, and with the D Sc of Edinburgh and the D P H of Cambridge Nasmyth left the ranks of general practice and became Fife's first medical officer of health, a post which he held until his retirement to Edinburgh, out of medicine and into the wider spheres of philanthropy, finance, and municipal politics these in the inverse order of their importance to him He became a Bailie, and might, had he so desired, have been supported for the Lord Provostship, but there were other things To his keen and balanced mind finance had an attraction, and as a director of one of the Scottish banks he devoted to this much time and activity

But if he had a great brain he had a bigger heart, and medical charities on the large scale appealed to him The Simpson Memorial Hospital was all along his special favourite, then the little but very well managed Deaconess Hospital of the Church of Scotland came very near his heart, while the Royal (Dick) Veterinary College was largely indebted to him for help in a favourite study of his—the relation of animal to human pathology All these and many helpful kindnesses of which nothing will be known fulfilled a busy life One other thing, of which perhaps he was as happy as any in its way he gave before the Royal Commission on the subject a strong

of the maternal soma so that the embryo was composed to a very considerable extent of the materials which had constituted its environment all the way through How was that which had come to it by inheritance to be distinguished from that which had been derived from its surroundings? The very ultimate conveyers of inheritance the chromosomes and genes as they grew and multiplied took in material from that by which they were surrounded

Support for the contention that any distinction between heredity and environment could only be applied to an organism at any given time and not for any sequence of time was afforded from human psychology Psychoanalysts had shown the signal importance of the earliest years of life throughout the period when the decisive power was held to emanate from the parents and many adult psychological disturbances known to have originated in childhood had come to be accepted as environmental and not inherited But how did the parental influence come to take its particular shape? Must it not have been decided in the parents own early years when their sensitive personalities were acted upon by the grandparents and must not the psychological part played by the grandparents have been determined for them by the grandparents and so back to infinity? This transmission of hereditary psychological qualities implied that the moulding of a child s nature by its parents was environmental only when its own generation was considered from the wider view of successive generations it was hereditary Dr Forsyth while disliking the coining of new phrases said that inherited environment precisely described the situation

Thus the argument pointed to the replacement of the dual idea of heredity and environment by some other concept of growth One iconoclasm led to another When there was no longer any constraint to think of organic life as being divided into these two independent aspects another well-established biological notion might be questioned In the development of all living things life itself as a phenomenon had always been regarded as comprised within each living particle, as the individual quality of each organism from amoeba to man The question was whether, having regard to the intimate association between an organism and its environment the idea of a separation could any longer be upheld and the term life still be restricted to one side of the dividing line

Life a Continuum

The body Dr Forsyth said was tunnelled by tubes and passages which reached its furthest interior recesses and were really prolongations and extensions of environment Along the alimentary canal flowed nutritives from outside currents of air, also from outside passed up and down the respiratory channel in fact the environment penetrated and permeated the organism Organism and environment overran one another spatially and structurally the frontier between them was involved The attempt to distinguish between hereditary and environmental influences having been relinquished any new conception must be based on the essential unity of an organism and its environment Life became a term to be extended to an organism s external environment, because life could no longer be conceived except as the joint attribute of environment and organism It resided in both and ceased to be the organism s exclusive possession

This suggested a further step The world teemed with organisms of each of which it was true that its life was a matter also of its environment But the individual environments such as water and air were not isolated from each other, they were continuous—an uninterrupted environment over the world s surface From this the idea was obtained of a continuum of life in which all living things were connected by means of their environment Life became a property of the chemico physical medium of water and air which was spread over the globe The term inherited environment which he had already suggested might now be extended to describe the physical environment of every living creature Were not its surroundings those of its parents and grandparents? Was not this an environment which was transmitted down the generations as truly and literally as were chromosomes and genes? Inheritance and transmission were features of environments as well as of organisms Heredity was no longer the distinctive and peculiar mark of the development of organisms but was shared by their environments and there it represented something in the nature of a persistence and repetition of chemico physical conditions

Dr Forsyth concluded an address of many interrogations with one more Can it be that what has been called inheritance and transmission in living matter is similarly an expression of a chemical and physical process which keeps on repeating and that life itself a repetitive process of this kind is as much the concern of environments as of organisms?

DETERMINATION OF THYROID ACTIVITY

At a meeting of the Liverpool Medical Institution on January 7, with the president Mr G C E Simpson in the chair Drs R T Goodyear and H S Pemberton contributed a paper on an electrical method of determining the level of thyroid activity

Dr Goodyear said that the method had been developed from the studies of Brazier who was working under a grant from the Medical Research Council It superseded oxygen metabolism work in that it required no collection from the patient and in that it appeared to be specific of the thyroid factor whereas basal metabolism was governed by factors several of them uncontrollable by the clinician The method was based on the observation that the phase angle of the body network was altered in thyrotoxicosis The measurement was made at a frequency of 9 000 cycles per second the patient having only to immerse the hands and forearms in a 1 per cent saline solution bath Within wide limits the measurement was unaffected by variations of saline strength temperature depth of immersion of the arms and by muscular movements The result was expressed numerically as the tangent of the phase angle or as Brazier termed it the impedance angle There was a marked difference of this angle in the sexes the method was also applicable to children The apparatus was portable and reasonably strong, and its cost was in the neighbourhood of £120

Dr Pemberton spoke of the results obtained in the measurement of the impedance angle in normal men and women, in states of disease other than of the thyroid gland in thyrotoxicosis in myxoedema and in patients before and after treatment for thyroid disease In thyrotoxicosis clinically definite and clinically indefinite types were described and from the former as well as from the change obtained after thyroidectomy it was claimed that the impedance angle had diagnostic significance The relations of this measurement with that of basal metabolism were discussed and standard deviations for normals were described A composite table was shown illustrating the mean values obtained from the measurement of large groups in all the categories mentioned

Mr Philip Hawe said that the most important feature of the method was the elimination of the difficulties and sources of error usually associated with the estimation of the basal metabolic rate It the results were confirmed it might be more readily possible to distinguish between cases of thyrotoxicosis and such states as neuro vascular asthenia In the speaker s experience cases of thyrotoxicosis treated by operation showed a definite change in the impedance angle in the direction of myxoedema, and it would seem from the results shown by Drs Pemberton and Goodyear that this change became even more marked as time went on

Dr Robert Kemp said that the frequency of thyrotoxicosis in the medical wards of the Liverpool Royal

Dr JAMES MCNIDDER, one of the oldest and best known of the general practitioners in Hull, died at his home on January 22 After studying medicine at the University of Edinburgh and the London Hospital he graduated M B, C M Ed in 1889, and took the M D with commendation in 1905 In his early days of practice he had held resident posts at the West Riding Asylum at Wakefield and at the Victoria Hospital for Sick Children, Hull He was for many years honorary physician to the Seamen's and General Orphanage, medical officer to the Hull and Sculcoates Dispensary and the municipal hospitals, and medical inspector under the local education authority Dr McNidder joined the British Medical Association in 1890, and was honorary secretary of the East Yorkshire and North Lincolnshire Branch from 1920 to 1931, and of the East Yorkshire Division from 1920 to 1923 He acted as representative of the Division at the Annual Meetings of the Association on thirteen occasions, the first being at Oxford in 1904 and the last at the Centenary Meeting in London in 1932 He was for many years a leading figure in the Hull Medical Society, and held office as honorary secretary and as president

Dr WILLIAM VERNON SHAW, a member of the medical staff of the Ministry of Health, died of pneumonia on January 21 following an attack of influenza Dr Shaw, who was 63, had a brilliant career at Oxford, where he gained first-class honours in the School of Natural Science, and at St Mary's Hospital After graduating M B, B Ch in 1900 and M A, M D in 1903, he was casualty physician at St Mary's He had a distinguished career in the public medical service first as medical officer of health for the Malton and Norton Rural District, and later at the Ministry of Health Dr Shaw was an expert epidemiologist, and did valuable work for the Ministry in the investigation of outbreaks of infectious disease in many parts of the country His diagnostic skill, particularly in small-pox, was recognized far and wide He did important work in connexion with the outbreak of typhoid at Bournemouth during last summer

Dr WILLIAM RICHARDSON, who died in London on January 6 after a long illness, had been medical superintendent of the Isle of Man Mental Hospital for thirty-two years He was born in 1856 and studied medicine at the University of Edinburgh, graduating M B and C M with first-class honours and the Ettles scholarship in 1877, and going on to the M D with special commendation in 1884 Not content with these degrees he obtained the B Sc in public health at Edinburgh in 1888 and the M R C S Eng diploma Before taking up his appointment in the Isle of Man Dr Richardson had been assistant medical officer at the Crichton Royal Institution, Dumfries, the Border Counties Asylum, Melrose and at Ticehurst House, Sussex He was for many years attached to the 7th Volunteer Battalion of the King's Liverpool Regiment, retiring as surgeon-major with the Volunteer Decoration Before giving up active work he had been a member of the British Medical Association for just on fifty years

Dr CHARLES JAMES MILLIGAN died at his residence, Ligoniel Belfast, on January 7, and thus has been removed another of the well-known and popular general practitioners from the older generation of Belfast doctors Dr Milligan obtained the Scottish triple qualification as long ago as 1888, and shortly after setting up in practice in the Ligoniel district was appointed dispensary medical officer About a year ago he felt that his general health was not sufficiently robust to continue practice, and he retired from his various public appointments and private practice much to the regret of the inhabitants of the district to whom he had been physician, friend, and adviser for nearly fifty years Dr Milligan had a wide circle of friends outside his medical colleagues, and adopted an enthusiastic attitude towards outdoor sports and games which received his whole-hearted encouragement and support His hobby was pigeons, and pigeon racing, angling, and shooting were pastimes which he enjoyed to the full and which he followed with interest His death is deeply regretted by his professional colleagues in Belfast, and the sympathy of all is extended to his widow and three sons

Medico-Legal

DAMAGES AGAINST AN UNQUALIFIED HEALER

A jury awarded on January 20 £490 damages and costs against a Mr G C Foster of Walthamstow, a "nature cure practitioner," for negligence in advice and treatment whereby a patient had to have his left leg amputated above the knee

Mr F W Sones, the patient, said that the trouble had started with a corn on the little toe of the left foot, which had become septic, and he had spent nine weeks in Mr Foster's house under treatment at eight guineas a week On August 17, when he arrived, an attendant sprayed the foot with antiseptic and administered a hot compress, applying a poultice at about midnight Mr Foster during the first six days had used a nail brush, which caused intense pain, about five times a day, and had then sprayed the foot and applied hot compresses On one occasion Mr Foster had inserted the foot in antiseptic and cut off a quantity of skin, afterwards pressing the foot by force into almost boiling water Other operations were performed for cutting off mortified skin under the foot and toes, and a little toe which had become necrotic On October 22 Mr Sones had been taken to St Bartholomew's Hospital, where his leg was amputated, and he returned home after convalescence on December 11 He had paid some £70 to Mr Foster for these useless and harmful services Mr R H Dale, a member of the resident staff of St Bartholomew's Hospital, said that Mr Sones was suffering from arteriosclerosis, and had gangrene as far back as the ankle If an operation had been performed when Mr Sones first went to Mr Foster it would probably have been safe to amputate seven inches below the knee The nail brush was not good treatment and was likely to do harm Mr Sones was an extremely good patient who tended to be stoical about pain

Mr Foster gave evidence and called witnesses to show that he was a "naturopath,' a medical herbalist, and a health practitioner, that he had practised nature cure for sixteen years, and that no complaint of his treatment had ever been made before He had never held himself out as a qualified medical practitioner When he had first examined Mr Sones mortification had extended to the ankle and inflammation to just below the knee-cap Two of the toes had been hanging on by the merest fraction of a diseased ligament There were patches of pus Mr Sones's general condition was deplorable he had gastritis, nervous prostration, and "catarrh of the liver." Mr Foster had at once considered that amputation was necessary but that the patient could not stand it He had dusted the leg with iodoform and encased it in a boracic dressing, then dressed it with yeast and charcoal poultices, and later bathed it with antiseptic One of the toes had dropped off in a poultice, and he had cut off the other toe with correct instruments The water into which he had put Mr Sones's foot had been only just about blood heat by the thermometer During his nine weeks' treatment he had localized the gangrene below the ankle, and Mr Sones's general health was as good as possible considering his arteriosclerosis He had never been anxious to take the case and had used the best skill of which he was capable

Legal View of Unorthodox Practice

Mr Justice Atkinson, in summing up, warned the jury that they must not consider any of the evidence which had been directed to show that Mr Foster had represented

no need to wait for this before setting other features of his scheme in operation The prefects are invited promptly to co operate in an investigation into the incidence of general paralysis of the insane since the introduction of modern methods of treatment with arsenic bismuth and malaria Has the clinical picture of general paralysis been profoundly changed by this treatment and how often does general paralysis end in its classical final stage? Why has not the modern treatment of syphilis prevented the appearance of general paralysis? These are some of the pertinent questions to which M Sellier hopes to get satisfactory statistical answers by inducing medical officers of mental hospitals to send in annual reports drafted according to a unified system he has devised It seems that social welfare workers are to play a large part in the venereal disease campaign and that they are to be employed in tracking down old sources of new infections M Sellier would like to see the diagnosis of general paralysis followed by an inquiry among the patient's relatives so that any of the latter found to be syphilitic may enjoy the benefits of specific treatment before they develop G P I And pending the formal adoption of the new regulations prefects must see to it that the opening of maisons de tolerance maisons de rendezvous and all the other maisons with terminologically seductive titles is frowned on officially

ENGLAND AND WALES

National Appeal for People's League of Health

Lord Leverhulme entertained members of the Press and others at luncheon at the Savoy Hotel on January 19 with a view to announcing the first national appeal of the People's League of Health He said that the League had now been in existence for twenty years It was conceived in the mind of one person Miss Olga Netherwastage and suffering should be prevented by removing their causes The League had published a large variety of authoritative pamphlets the work of medical experts in their different fields It had promoted health weeks and instituted courses of lectures Over eighty men and women eminent in the medical world gave their expert knowledge on its medical council and it had also science and veterinary councils Through committees of experts it had investigated specific problems and the findings when these were conclusive had been impressed on the Government by deputations He referred to the Safe Milk Campaign instituted by the League in 1930 and its present inquiry into maternal mortality and morbidity which had established the important presumption that some of the ills attending pregnancy could be attributed to certain deficiencies in diet If these deficiencies could be made good it was believed that a serious diminution in the toll of maternal mortality and morbidity would result A large scheme to this end had been initiated by the League with the co operation of nine London hospitals Coming to the appeal Lord Leverhulme said that hitherto the work of the League had depended on the annual subscriptions of a comparatively small number of supporters It was desired to enlarge its scope to press on with the inquiries already initiated to tackle new problems and to give a permanence to the work The information bureau could with advantage be developed into a central almoner service for supplying to the country generally the service which almoners gave to hospitals It was hoped also to carry out an investigation into the conditions under which infants and young children were received by foster-parents Further studies were projected regarding the amount of disease and suffering caused to children by infection with the bovine variety of the tubercle bacillus The appeal would be inaugurated by a banquet at the Guildhall on April 15 over which the Lord Mayor would preside and at which support for the cause would be given by Lord Horder and other eminent speakers The thanks of the company to Lord Leverhulme for his hospitality were voiced by Dame Louise McIlroy

Guy's Hospital Medical School

An important extension is now in course of erection at the Medical School of Guy's Hospital The new building will provide for a complete pathological institute and give much more accommodation to every other department except chemistry which will not be affected by the change When the extension is completed the whole school will be centralized in one block of buildings with easy access between the various departments The new building will provide (1) A large and modern pathological department with plenty of research accommodation (2) pathology bacteriology and clinical chemistry housed under one roof (3) adequate accommodation for the medical research unit and for the pharmacological department (4) a physics department large enough to prevent the necessity of the duplicating of classes (5) an extension of the research accommodation available in the physiological department (6) an additional demonstrator's laboratory and an extension to the dissecting room and (7) a large staff common room for the members of the clinical staff and the teaching staff of the school The removal of the physics department from the existing buildings will enable better accommodation to be found in the school for operative surgery and for x ray living anatomy and human physiology

Empire Conference on Tuberculosis

Under the auspices of the Over seas League and Papworth Village Settlement an Empire conference on the care and after care of tuberculosis will be held in London, at Over seas House from May 3 to 8 The patron is H R H the Duke of Kent and the president Lord Willingdon The conference is being arranged in view of the large number of medical women and others interested in tuberculosis who will visit London from the Dominions and Colonies for the Coronation The success of the Papworth Settlement not only in arresting tuberculosis but in employing the ex patient in productive industry suggests that there is an urgent need for the study of similar methods throughout the British Empire A preliminary programme has been drawn up for the six sessions the subjects being the fight against tuberculosis the after care of the tuberculous and the native races and tuberculosis throughout the Empire The chairmen include Lord Dawson of Penn Lord Horder and Professor Lyle Cummins and the speakers Sir Kingsley Wood Sir Pendrill Varrier-Jones Dr B A Dormer Lieut Colonel G G Jolly I M S and Dr P V G Benjamin followed by representatives from the Dominions Colonies and Protectorates Application forms may be obtained by those wishing to take part in the proceedings from the secretary of the conference Sir Evelyn Wrench at Over seas House St James's S W 1

Radium Institute for Bradford

The Lord Mayor of Bradford presided over a meeting at the Town Hall on January 21 to inaugurate an appeal for £50 000 for the establishment of a radium institute in that city He explained that the proposal to make this a Coronation Year Memorial had come to him from an eminent Bradford surgeon The provision of the institute would be a purely voluntary effort controlled by a committee A site was available without cost in the grounds of the new Royal Infirmary Dr Chester Williams said that the work of the radium therapy clinic at the Royal Infirmary had doubled since its establishment about eight years ago He emphasized the importance of centralizing the use of radium Mr Peter McEwan also spoke in commendation of the appeal and the mayors of Halifax Keighley and Brighouse each promised the support of their towns

Dr JAMES MCNIDDER, one of the oldest and best known of the general practitioners in Hull died at his home on January 22 After studying medicine at the University of Edinburgh and the London Hospital he graduated M B, C M Ed in 1889, and took the M D with commendation in 1905 In his early days of practice he had held resident posts at the West Riding Asylum at Wakefield and at the Victoria Hospital for Sick Children, Hull He was for many years honorary physician to the Seamen's and General Orphanage, medical officer to the Hull and Sculcoates Dispensary and the municipal hospitals, and medical inspector under the local education authority Dr McNidder joined the British Medical Association in 1890, and was honorary secretary of the East Yorkshire and North Lincolnshire Branch from 1920 to 1931, and of the East Yorkshire Division from 1920 to 1923 He acted as representative of the Division at the Annual Meetings of the Association on thirteen occasions, the first being at Oxford in 1904 and the last at the Centenary Meeting in London in 1932 He was for many years a leading figure in the Hull Medical Society and held office as honorary secretary and as president

Dr WILLIAM VERNON SHAW a member of the medical staff of the Ministry of Health, died of pneumonia on January 21 following an attack of influenza Dr Shaw, who was 63 had a brilliant career at Oxford, where he gained first-class honours in the School of Natural Science, and at St Mary's Hospital After graduating M B, B Ch in 1900 and M A, M D in 1903, he was casualty physician at St Mary's He had a distinguished career in the public medical service first as medical officer of health for the Malton and Norton Rural District and later at the Ministry of Health Dr Shaw was an expert epidemiologist and did valuable work for the Ministry in the investigation of outbreaks of infectious disease in many parts of the country His diagnostic skill, particularly in small-pox, was recognized far and wide He did important work in connexion with the outbreak of typhoid at Bournemouth during last summer

Dr WILLIAM RICHARDSON, who died in London on January 6 after a long illness, had been medical superintendent of the Isle of Man Mental Hospital for thirty-two years He was born in 1856 and studied medicine at the University of Edinburgh, graduating M B and C M with first class honours and the Ettles scholarship in 1877, and going on to the M D with special commendation in 1884 Not content with these degrees he obtained the B Sc in public health at Edinburgh in 1888 and the M R C S Eng diploma Before taking up his appointment in the Isle of Man Dr Richardson had been assistant medical officer at the Crichton Royal Institution Dumfries, the Border Counties Asylum, Melrose, and at Ticehurst House, Sussex He was for many years attached to the 7th Volunteer Battalion of the King's Liverpool Regiment, retiring as surgeon-major with the Volunteer Decoration Before giving up active work he had been a member of the British Medical Association for just on fifty years

Dr CHARLES JAMES MILLIGAN died at his residence, Ligoniel Belfast, on January 7 and thus has been removed another of the well-known and popular general practitioners from the older generation of Belfast doctors Dr Milligan obtained the Scottish triple qualification as long ago as 1888, and shortly after setting up in practice in the Ligoniel district was appointed dispensary medical officer About a year ago he felt that his general health was not sufficiently robust to continue practice, and he retired from his various public appointments and private practice much to the regret of the inhabitants of the district to whom he had been physician, friend, and adviser for nearly fifty years Dr Milligan had a wide circle of friends outside his medical colleagues, and adopted an enthusiastic attitude towards outdoor sports and games which received his whole hearted encouragement and support His hobby was pigeons, and pigeon racing, angling, and shooting were pastimes which he enjoyed to the full and which he followed with interest His death is deeply regretted by his professional colleagues in Belfast, and the sympathy of all is extended to his widow and three sons

Medico-Legal

DAMAGES AGAINST AN UNQUALIFIED HEALER

A jury awarded on January 20 £490 damages and costs against a Mr G C Foster of Walthamstow, a "nature cure practitioner," for negligence in advice and treatment whereby a patient had to have his left leg amputated above the knee

Mr F W Sones, the patient, said that the trouble had started with a corn on the little toe of the left foot, which had become septic, and he had spent nine weeks in Mr Foster's house under treatment at eight guineas a week On August 17, when he arrived, an attendant sprayed the foot with antiseptic and administered a hot compress, applying a poultice at about midnight Mr Foster during the first six days had used a nail brush, which caused intense pain, about five times a day, and had then sprayed the foot and applied hot compresses On one occasion Mr Foster had inserted the foot in antiseptic and cut off a quantity of skin, afterwards pressing the foot by force into almost boiling water Other operations were performed for cutting off mortified skin under the foot and toes, and a little toe which had become necrotic On October 22 Mr Sones had been taken to St Bartholomew's Hospital where his leg was amputated, and he returned home after convalescence on December 11 He had paid some £70 to Mr Foster for these useless and harmful services Mr R H Dale, a member of the resident staff of St Bartholomew's Hospital, said that Mr Sones was suffering from arteriosclerosis and had gangrene as far back as the ankle If an operation had been performed when Mr Sones first went to Mr Foster it would probably have been safe to amputate seven inches below the knee The nail brush was not good treatment and was likely to do harm Mr Sones was an extremely good patient who tended to be stoical about pain

Mr Foster gave evidence and called witnesses to show that he was a "naturopath, a medical herbalist, and a health practitioner that he had practised nature cure for sixteen years and that no complaint of his treatment had ever been made before He had never held himself out as a qualified medical practitioner When he had first examined Mr Sones mortification had extended to the ankle and inflammation to just below the knee cap Two of the toes had been hanging on by the merest fraction of a diseased ligament There were patches of pus Mr Sones's general condition was deplorable he had gastritis, nervous prostration, and "catarrh of the liver" Mr Foster had at once considered that amputation was necessary but that the patient could not stand it He had dusted the leg with iodoform and encased it in a borasic dressing, then dressed it with yeast and charcoal poultices, and later bathed it with antiseptic One of the toes had dropped off in a poultice and he had cut off the other toe with correct instruments The water into which he had put Mr Sones's foot had been only just about blood heat by the thermometer During his nine weeks' treatment he had localized the gangrene below the ankle and Mr Sones's general health was as good as possible considering his arteriosclerosis He had never been anxious to take the case and had used the best skill of which he was capable

Legal View of Unorthodox Practice

Mr Justice Atkinson, in summing up, warned the jury that they must not consider any of the evidence which had been directed to show that Mr Foster had represented

statistical results following the use of radium have been even worse than following the operation alone I believe however that very few, if any, surgeons besides myself have over a number of years employed radium, or radium combined with very conservative surgery in the treatment of early carcinoma of the breast In my experience the results of these methods have proved to be virtually the same as those obtained from the best surgery and I have seen no reason for abandoning the use of radium I hope later to be able to publish a report of the results obtained with radium up to the end of March or April of this year

Radium technique has not stood still since it began to be developed at St Bartholomew's about twelve years ago and its value and limitations in cancer of the breast began to be fairly clear—I am, etc,

London W1 Jan 24 GEOFFREY KEYNES

The Problem of Endemic Goitre

SIR,—Dr George Graham, referring in your issue of January 23 to my article on the above subject (*British Medical Journal* January 2 p 29), draws attention to a mistake" which he considers I made in attributing the discovery that cyanides may cause goitre under certain conditions to Webster The passage in my article to which he refers is this Among those [chemical substances] capable of causing goitre in animals under experimental conditions are calcium, boron, silica, tellurium organic acids amines (Pighini, 1933) and cyanides (Webster, 1933) The references here are not to discoveries but to a convenient source—*Proc International Congress on Goitre* Berne, 1933—from which those who desire it may obtain recent information in regard to these goitrogenic substances—I am, etc,

Oxford Jan 23 R MCCARRISON

Treatment of Prostatic Obstruction

SIR,—In his letter in your issue of January 16 on prostatic obstruction Mr F McG Loughnane states that generally at least 96 per cent of prostatic patients can be successfully treated by endoscopic resection If *generally* here means all and sundry who have access to a resectoscope, a word of warning must be sounded Even in the hands of those with most experience in this method of treatment it is doubtful whether a really successful issue can be secured in this high proportion of cases and it is certain that a very great deal of experience is required before even moderately large glands can be attacked endoscopically with a reasonable chance of giving a result satisfactory to the patient In this connexion it is not sufficiently appreciated that even a small residuum of infected urine may be death dealing some time after the patient has left the hospital A completely emptying bladder must be secured A further late complication which has not received sufficient attention is the development of an intractable prostatitis in the portion of the gland inevitably left behind in an endoscopic resection this is not common, but sufficiently often met with to warrant consideration when sizing up the pros and cons for closed *versus* open operation in any particular case Finally in my experience considerably more than 4 per cent of prostatic patients have a urethra of a calibre insufficiently large to admit the commonly used 30F resectoscope No amount of preliminary dilatation will allow such small urethrae safely to accommodate the instrument The smaller gauge resectoscopes may be employed in such cases but entail a long and wearisome procedure where the gland is of considerable proportions The use of unduly large instruments has led to a not inconsiderable number of urethral strictures

I introduced the modern transurethral (endothermy loop) prostatic resection operation into this country in September, 1930 and after an experience of more than 400 cases (largely municipal hospital patients) am satisfied that the functional results are not so satisfactory as enucleation for general enlargement of the gland The transurethral type of operation may be employed in grossly enlargements where the open operation appears to carry an unnecessary operative risk but in a good risk case should not be the first choice For an eighteen month period in 1932–3 I employed the endoscopic technique in approximately 90 per cent of *prostatic obstructions in* hospital practice but after a careful follow up of my cases have reached the above conclusion The brilliant work, moreover of the late S Harry Harris has given urological surgeons a more exact method of securing haemostasis in the open surgery of the prostate and an almost certain means of preventing post operative obstruction To those who have mastered the technique of this procedure the endoscopic resection of a generalized enlargement of the *prostate in a relatively good risk* case will be seldom employed

Endoscopic resection has a very definite place in the treatment of the fibrous prostate or sclerotic bladder neck, post prostatectomy obstructions obstructing carcinomatous glands (where not unduly large) and certain bad risk cases of generalized enlargement In the remainder constituting the majority of prostatic obstructions my present view is that open surgery gives more satisfactory results

I have reviewed my series of prostatic obstructions treated during the past two years and find that I have employed endoscopic resection in 32 per cent one stage Harris prostatectomy in 40 per cent two stage prostatectomy in 21 per cent Steinach II in 3 per cent and suprapubic cystostomy alone in 4 per cent These figures of course represent only the views of an individual surgeon but my object in bringing them forward is to decry the application of a standard operative technique in cases of prostatic obstruction where the concomitant complications are so varied—I am etc

London W1 Jan 18 TERENCE MILLIN

SIR—I read with great interest Mr F McG Loughnane's letter in the *Journal* of January 16 (p 144) He raises several points with which I should like to deal

The first refers to Mr Loughnane's advocacy of posterior urethroscopy This is a most valuable procedure especially immediately *before during and after the* operation of perurethral resection of the prostate I do not however regard it as an essential diagnostic procedure to be carried out in every case A simple cystoscopic examination of the bladder neck to my mind readily indicates the type of case suitable for suprapubic prostatectomy without adding to what is already a somewhat laborious investigation It is especially when doing a perurethral resection that posterior urethroscopy is so essential and I have carried it out in almost all my resections The construction and the additional direct telescope of the von Lichtenberg Hevwal resectoscope permit an admirable view of the whole prostatic urethra so that the operator's attention may be drawn to any convexity, bar etc which may require elimination

The second point which Mr Loughnane raises touches one of the fundamental points which I attempted to emphasize Towards the beginning of my article I freely admitted that excellent series of results could be and were

Assistance for Voluntary Hospitals in Special Areas

Asked on January 21 whether the Commissioner for the Special Areas had made grants to voluntary hospitals towards the alteration or extension of their buildings Mr ERNEST BROWN said that particulars of the earlier decisions were found in the third report of the Commissioner for Special Areas (England and Wales) This covered the period to September 30, 1936 Schemes for assisting voluntary hospitals similarly approved since that date were

Hospital	Nature of Work	Location of Work	Estimated total cost
Sunderland Royal Infirmary	Construction of new out patient department ward block nurses home and staff quarters	Sunderland	£83 500
Blaina and District Hospital	Additions to surgeon's room and mortuary provision of ultra violet ray and other equipment and new motor ambulance	Blaina	£874
Rhymney Cottage Hospital	Provision of new x ray room nurses bedroom new ambulance and other equipment	Rhymney	£2 067

Thefts of Drugs from Doctors' Cars

Mr RHYS DAVIES asked on January 21 whether the Home Secretary proposed any action to prevent the recurrence of cases in which members of the medical profession had dangerous drugs stolen from their motor cars Sir JOHN SIMON said he had no grounds for thinking that these thefts were other than ordinary cases of petty larceny There was no action he could usefully take in the matter Mr DAVIES asked whether some responsibility should not be placed on the medical profession for neglecting to take care of these dangerous drugs Sir JOHN SIMON replied that the remedy was exercise of care by the individual who had such a package in his charge When he considered how many skilled doctors were moving about attending medical cases and how many had something of the sort with them he did not deem the number of thefts to be very surprising

Drunkenness as a Ground for Divorce

Consideration of the Marriage Bill was resumed in a standing committee of the House of Commons on January 21 Mr A P Herbert mentioned that the two other members who sponsored the Bill were absent because of influenza

On Clause 2—grounds of petition for divorce—the committee continued to discuss an amendment, previously moved by Mr Spens to omit from the grounds of petition for divorce the ground that the respondent

> ' (a) is an incurable habitual drunkard and has for a period of at least three years been separated from the petitioner in consequence of habitual drunkenness '

Mr SPENS said it would be difficult to get a common ' yard stick ' with which to measure the amount of drunkenness which ought to constitute a ground for final dissolution of marriage

Mr HERBERT said that if the paragraph stood with the omission of the word ' incurable ' habitual drunkenness would be ground for a petition and the term ' habitual drunkard ' was strictly defined in the interpretation clause For the purpose of separation orders the Statute Book defined ' habitual drunkard ' and used the words that the person " is at times a danger to himself and others " The words in the interpretation clause of this Bill were, ' is habitually a danger to himself and others ' Once the state of affairs had been established and in consequence a separation had followed, there would have to be a three year interval, after which the applicant for divorce must show that the same state of things still existed which would be difficult to do Under the Summary Jurisdiction Act and the Licensing Act of 1902 it was possible for a husband or wife to get a non cohabitation order or separation order on the ground of habitual drunkenness Only fifty-three such orders were made in 1934, forty-two being granted to husbands and eleven to wives Few people now attained to the degree of drunkenness which these Acts contemplated The problem of drunkenness was far less serious now than when the Royal Commission on Divorce reported

After further debate the Solicitor General, Sir TERENCE O'CONNOR, said little difference would be made whether the words under discussion were retained or deleted There was a difficulty in defining ' habitual drunkard,' and a great many cases involving the difficulty would be covered by a cruelty paragraph of the present Bill Partners of drunken brutes could go to the court and make out a case of constructive cruelty which was damaging to health The very definition of habitual drunkenness which appeared in the clause under discussion would in his opinion constitute desertion in the great majority of cases When the husband constantly came home drunk and made the home impossible to live in constructive desertion occurred as Lord Merrivale had ruled

The amendment to strike out Clause 2 (a) was carried without a division

After further amendment Clause 2 was ordered to stand part of the Bill

The sitting of the Committee on January 26 was occupied in a general discussion

Capitation Fee for Young Persons

Mr RHYS DAVIES asked on January 21 whether the Minister of Health had been able to secure agreement with the medical profession in relation to the fees to be paid in respect of young persons entering into employment for the first time Sir KINGSLEY WOOD answered that he was still in communication with representatives of the medical profession on this matter and was not yet in a position to make a statement

Local Authorities' Air Raid Protection Schemes

On January 25 Mr LLOYD informed Mr Levy that out of 174 county councils and county and metropolitan borough councils about 100 had submitted schemes to the department for advice and assistance concerning the protection of the civilian population in air raids

The only county borough which at present had intimated that it would not co operate was Barnsley At present the attitude of the Home Office was that the co operation which the office had received from local authorities throughout the country had been developing in the right direction so satisfactorily in recent months that it would prefer to rely on the development of public opinion in the areas concerned to bring the other authorities into line The Home Secretary was at present considering representations made by a deputation in regard to cost to local authorities The preparation of a scheme such as had been asked for by the Home Office did not involve much more than the time of certain local officials

Small-pox at Oldham—Sir KINGSLEY WOOD told Mr Tom GROVES on January 19 that the first case of small-pox in the recent outbreak at Oldham was notified on November 27, 1936 This patient was probably infected about twenty three days earlier, the interval including the period of incubation when there were no clinical manifestations Nine cases in all had been notified at Oldham

Doncaster Scarlet Fever Outbreak—In an answer to Mr Alfred SHORT on January 21 Sir KINGSLEY WOOD said 160 cases of scarlet fever occurred in Doncaster and the adjoining rural district in a recent outbreak, together with a considerable number of cases of sore throat The outbreak was due to infection of milk from one farm When that milk supply had been identified as the source of infection arrangements were made for pasteurization of all milk from that source He could not say more at present about steps to prevent similar outbreaks

tion without any more alarming symptoms however and with full functional effect upon the blood picture When I last saw the patient she was again in good condition though profuse menstrual loss was still troublesome In all the transfusions citrated blood was employed and was given through a small needle at the rate of 10 c.cm. per minute

These particulars are given by permission of the county medical officer of health

I am, etc.

A. T. Jacob, M.R.C.P.
Assistant Medical Officer, Paddington T.C.C. Hospital

Oslo, Jan. 11

Sclerosing Submucosal Injection of the Turbinates

SIR,—Doubtless Mr. C. A. Hutchinson's technique for reducing hypertrophied turbinates (*Journal*, January 9, p. 62) will accomplish their shrinkage and his strictures on the wrong way which seems to be the common way of using the cautery for this purpose are just. But there is a right way suggested many years ago by an American in the *Laryngoscope*. Mr. Hutchinson correctly says that the object should be shrinkage without damage to the cilia. This can be obtained by using a fine rather long cautery *point puncturing the fore end of the lower turbinate* with it and pushing it gently into the substance of the turbinate where it can be further manipulated without damage to the cilia save at the neglectable puncture. The Ouchn needle can be used to the same effect. I am, etc.,

Glasgow, Jan. 17 JAMES ADAM, M.D.

Substances Promoting Cell Growth

SIR,—The interesting paper in the *Journal* of October 10, 1936, by Dr. Joseph Needham (p. 701) on substances promoting normal and abnormal growth stimulates me to voice ideas which for some time have been forming in my mind and which have been published elsewhere.

It is evident that every living cell has an organizer or normal growth factor in its make-up. This organizer is not even destroyed by boiling, and its chemical nature belongs to the class of sterols and is closely related to carcinogenic substances such as tar, etc. Needham has shown us how hormones and vitamins can promote or delay growth according to their absence or presence. They may have a specific action on certain tissues as is the case with pituitary or ovarian hormone, even to the extent of producing mammary cancer in mice with certain hereditary factors. The question now becomes one of "What prevents cancer?" rather than "What causes cancer?" When cells took on communal life it became urgently necessary that some limitation be placed on how many of each variety would be allowed to survive, so some method had to be devised to limit their numbers to the required amount. This could only be done by depriving them of some normal growth factor they originally possessed. It had to be some mechanism common to all the cells. Cells had to be nourished and their waste products removed; in the primitive organisms this was carried out by lymph circulation. To remove the organizer or normal growth factor the cells lining the lymph channels must have possessed some selective activity on this particular substance. Sampson Handley has shown clearly that when the terminal lymph tubules become blocked by organisms or exfoliative epithelium enormous hypertrophy of the papillae drained by them takes place. This eventually in many cases becomes malignant. In a normally functioning animal the organizer is kept within bounds, but should an abnormal amount be continually applied to one spot it is not to be wondered at that the normal mechanism breaks down and uninterrupted growth takes place, as happens on the constant application of tar, etc.

From whatever angle we look at the subject we have to concentrate on the factor which is normally responsible for the extraction of the organizer present in every living cell and find out why it is failing in its job. Once a group of cells is deprived of this restraining influence it becomes equivalent to culturing living cells *in a satisfactory medium in vitro*. The commonest blockage of lymph terminals is by collections of organisms and epithelial debris, though cold can also do it, as seen in chilblains, and cold as well as heat can produce malignancy. It has been suggested that if this was so one ought to find malignancy in elephantiasis. In this condition it is the lymphatic *channels and not the terminals that are blocked*. With the blockage of the terminals strangulation of vessels ensues and destruction of the epithelial lining of the terminals takes place. With blockage of the lymphatic channels there is not necessarily any destruction of the epithelial lining of the terminals which still carry on their selective activity. Must we not then cease to look *for the cause of malignancy but concentrate on the reason why we do not all get cancer?* I am, etc.

SYDNEY PERN, M.R.C.S., L.R.C.P.

Ballarat, Australia, Dec. 4, 1936.

Pathogenesis of Cancer

SIR,—It may interest the eminent surgeon Mr. Leard (*Journal*, January 16, p. 111) to know that conditions in Egypt support his theory regarding nutrition and sex conditions as agents causative of cancer. Having practised for twenty-seven years in Cairo the absence of cancer among the fellaheen has struck me as very remarkable. They live a primitive life among their diseases and dirt, working from sunrise to sunset often in a blazing sun on starvation wages. On the other hand among those Egyptians who live in luxury and laziness at the expense of the vast majority the same cannot be said, and according to recent information with them malignant disease is becoming more common. By way of illustration some striking examples could be quoted. Of course the vitality of the sex hormones is proverbial, but the sex life in comparison with Europeans is short due to various causes, but mostly to the universal use of the so-called aphrodisiacs such as hashish, etc., now however not so easily obtainable by the worker especially. I am, etc.

Folkestone, Jan. 19 J. GERALD GARRY, M.D.

Recurrent Extrapenital Haemorrhages

SIR,—A few days after having read the interesting article by Dr. William H. Gossip (*Journal*, January 9, p. 69) on recurrent extrapenital haemorrhage I was called to see a young lady, 19 years of age, who informed me that she had had a spontaneous bleeding from the right eye. She was menstruating at the time. She and her mother, who were greatly alarmed at the haemorrhage, estimated the amount of blood lost from the eye at about one teaspoonful. This was the first occasion on which she had had any extrapenital bleeding associated with menstruation. In her case there is a distinctly raised blood pressure. During the past year it has ranged from 90 to 100 mm. Hg diastolic and from 140 to 160 mm. Hg systolic. She is of plethoric habitus and suffers from frequent headaches. There is no history of epilepsy or hysteria. I am, etc.

Edinburgh, Jan. 22 DOUGLAS ROBERTSON

On the occasion of the thirtieth anniversary of the foundation of the Luigi Mangiagalli Obstetrical and Gynaecological Clinic at Milan a special issue of the *Annali di Ostetricia e Ginecologia* has been published consisting of 956 pages, and containing twenty papers illustrating the various activities of the clinic

The issue of the *Nederlandsch Tijdschrift voor Geneeskunde*, the organ of the Dutch Medical Association, for January 16 contains a sympathetic obituary notice of Sir Grafton Elliot Smith, by Dr C Winkler

General Mazzetti has been recently nominated director-general of the Italian Army Health Service in succession to Professor Franckel

Dr Gosset, professor of clinical surgery in the Paris faculty of medicine, and surgeon to La Salpetriere, Paris, has been presented with a sword of honour by his pupils and friends on the occasion of his election to the Academie des Sciences

Sir Ernest Graham-Little, M P, has been elected a member *honoris causa* of the Polish Dermatological Society

QUERIES AND ANSWERS

Dermatitis of the Feet

Dr G FRANCIS SMITH writes in reply to 'H A (January 23 p 202) The soles of the feet should be dusted with the ordinary boric acid starch and oxide of zinc powder immediately before gymnastic work and the patient should wear a loofah sock procurable at any boot shop inside the rubber shoe Care should also be taken that only dye fast stockings be worn

Income Tax

Fees Earned after Retirement

RETIRED G P' has received on two occasions since his retirement £31 in all for expenses and (presumably) services in connexion with a legal dispute Is he liable to tax thereon?

*** The point can be disputed on the technical ground that it is difficult to fit such a case into the statutory division of income On the whole we think that the revenue authorities could show good cause for including in his income tax liability such portions of the total amount as fairly represent a payment for time and professional services The liability would be under Schedule D, and probably under Case VI of that schedule—' profits or gains not falling under any of the foregoing cases"

LETTERS, NOTES, ETC.

Epidemic Appendicitis

Dr J R D WEBB (Didcot, Berks) writes Seeing the abstract of an article on epidemic appendicitis (*Epitome*, December 26, 1936, para 521) reminds me of a similar occurrence on a smaller scale in rural Berkshire In the month of October, 1936, I saw in rapid succession six cases of acute appendicitis which I concluded must be of epidemic character They were directly associated with each other The first case appeared in a farm labourer aged 26, previously in perfect health He seemed clinically to be an indefinite case of gastro enteritis Suspecting a possible appendicitis I visited him three times daily I found nothing definite in his signs and symptoms at these visits On the third day the appendix perforated he was operated upon at once, but died The second case occurred in the same house in a few days The mother of the labourer developed a similar gastro intestinal attack She was at once admitted to hospital and on operation a gangrenous appendix was removed and she recovered The third case was the young labourer's fiancee She showed definite signs of an acute appendicitis She was treated by conservative measures and recovered The fourth fifth, and sixth cases followed in rapid succession all were admitted to hospital and were successfully operated on No cause could be found for these six cases of apparent epidemic appendicitis In rural England appendicitis has become a popular complaint in farm hands and domestics the signs and symptoms developing consciously or subconsciously, and some surgeons declare that of all appendices removed from such subjects only 40 per cent are found diseased I do not believe that these six cases here recorded were in this "psychological appendix group

Treatment of Peptic Ulcer

Dr H W HALLS (London W 1) writes My attention has been drawn to Dr Hort's letter published in the *Journal* of December 12 1936 (p 1228) May I be permitted to endorse his views as to the value of colonic lavage with potassium permanganate in gastric and duodenal ulcer By combining this technique with suitable, reduced vegetarian diet, and perhaps duodenal intubation and feeding, I have succeeded in obtaining results which seem to have rendered surgery and alkalis unnecessary I regard gastric and duodenal ulcers as toxic in origin and primarily dependent on intestinal toxaemia

Treatment of Pyorrhoea

Lieut Colonel H H KING C I I M S (ret) writes from Bensonsfield In looking over old papers I found I had made a note of the value of forcible irrigation in a case of pyorrhoea alveolaris in an Indian in East Africa during the war It was a most acute case that rapidly improved under repeated irrigation with dilute peroxide given forcibly from a four ounce ear syringe with the nozzle set against the teeth so that the solution squirted into the tooth sockets between the teeth and the gums—the patient meantime hanging his head out of bed over a bucket Perhaps this observation of the use of irrigation with pressure—and, as your readers are aware considerable pressure can be attained with a four-ounce syringe—is of sufficient interest to merit record

Calcium Aspirin

In our issue of January 9 (p 77) we stated in relation to calcium aspirin that The manufacturers Genatosan Ltd of Loughborough have now succeeded in preparing the drug in a stable form' The manufacturers have written to us pointing out that the work referred to was done by Myer Coplans and Green (*J Soc chem Indust* 1935 54, 805) and that Messrs Genatosan are the sole manufacturers and distributors of the product

Dr A C MACIAN writes from Manchester to disclaim responsibility for notices which have appeared in the lay press with reference to his work in a local hospital

pression of apparent fluctuation There was no lymphangitis and no epitrochlear or axillary adenitis On account of the apparent fluctuation of the dorsum of the hand this was incised over the site of the puncture wound No pus was obtained and very marked congestion was observed An intramuscular injection of 20 c.cm of anti streptococcal serum was given along with a prophylactic injection of 1 000 units of anti tetanus serum The next day the patient experienced slight nausea and vomited bile stained mucus His temperature was then 100 F pulse rate 104 The whole forearm was now the seat of massive oedema and quite indurated though there was no pain The patient slept well that night The following day he was obviously ill and toxaemic By this time the whole upper arm shoulder and clavicular region on the right side was oedematous and indurated There was no crepitation despite this anti gas gangrene serum was given At 10 30 p.m the patient suddenly collapsed became cyanosed and drooled vomit He was obviously *in extremis* The usual restoratives were administered and 15 c.cm of anti streptococcal serum were given intravenously after 5 c.cm of blood had been withdrawn for blood culture The oedema of the whole upper extremity was intense the limb having the appearance of a thigh rather than an arm The patient died at 4 a.m Blood culture revealed a most profuse growth of *Bacillus anthracis*

The main points of interest in this case are (1) the nature of the injury (2) the absence of the development of the typical malignant pustule with eschar, vesicles etc (3) the massive oedema which was always a salient feature of the case (4) the sudden profound toxaemia with fatal result

Of the three types of anthrax infection the anthrax oedema I understand is the rarest and I have never heard of a similar case without the presence of a malignant pustule The case taught me a sharp lesson and has led me to wonder if a prophylactic injection of an organic arsenical would not be advisable as a routine in all wounds of a similar nature—I am etc,

Galashiels Jan 9 WALTER R BLACK, M.B Ch.B

International Good Will

SIR—I have been waiting in vain for an abler pen than mine to urge on you the necessity of keeping ever in our thoughts the most important subject of all the maintenance of peace and good will among the Nations Will you not Sir, as Editor of the most influential medical journal in the world, use all your influence to give a lead to the profession not only in this, but in all civilized countries?—I am, etc

London N Jan 24 D S BRYAN BROWN

*** There can be very few readers who do not share Dr Bryan Brown's feeling We shall continue to promote *international good will in the world of medicine* hoping that by this means the cause of peace may be served—ED *B.M.J*

The New Typography

SIR—I suppose it is useless now to protest against the new front page cover of the *Journal* but I may be permitted to ask why the constituency was allowed no voice in the matter If I were to contend that the old front page had attained to the dignity of a traditional landmark to interfere with which was almost an act of vandalism I should doubtless be told that like myself it was out of date, and that some outward and visible sign was required to mark the note of inward and spiritual progress which now characterizes the contents of the inside pages Well so be it But why in substitution for Sir Charles Hastings's picturesque and dignified head, *must we have imposed upon us the final omega like* death wriggle of an earthworm as it emerges from beneath a garden roller? Is it too late to have a plebiscite on the subject of the retention of this fantastically ugly and wholly meaningless innovation?—I am etc

London W.1 Jan 24 LEONARD WILLIAMS

*** Here Dr Leonard Williams with disarming gaiety, records his contempt for the new cover and suggests that the details of a complete typographical *reform ought to* have been submitted beforehand to 36 500 members So far his is almost the only discordant note in the chorus of approval—ED *B.M.J*

BRITISH COLLEGE OF OBSTETRICIANS AND GYNAECOLOGISTS

A quarterly meeting of the Council was held in the College House 58 Queen Anne Street London on January 23 with the President Sir Ewen Maclean in the chair

The following were admitted to the Membership of the College

Gora Chand Nardi Calcutta Mangaldas Mehta Bombay (*in absentia*)

The following were elected to the Membership of the College

Geoffrey Sheddan Adam Australia Richard Farel Williamson Kinkead Allen India Doris Crystal Bates Merbeck France Arthur Bellingham Australia Edith Brown India Harold Henry Caple Canada William Clement Glasgow Duncan Leo Finlayson Birmingham William Frame Flint Gibson Plymouth Joseph Ganner Birmingham Arthur Lionel Gibney Portsmouth Uma Patt Gupta India William Hunter Newcastle-upon-Tyne Claude Wilfred Alfred Kimbell New Zealand William Alexander Liston Edinburgh John Robertson McArthur Canada William Leonard MacCormac London Barbara Martin Macewen London Margaret Martin McDowell Halifax Kelvin Alvard McGarvey Southend-on-Sea Gerald Maizels London Gladys Helen Marchant India Charles Ferdinand Marks Sheffield William Ian Clinch Morris Edinburgh Harry Stafford Morton London Bryan Charles Murle s London Dudley Clifford Raker Manchester Louis Rich Manchester Charles Bernard Edward Richards Manchester George Walter Robson Canada, John Murdie Sanderson

enlarged The following technique was used, 200 kV constant potential, filters 1 5 mm of copper plus 0 5 mm of aluminium, 40 cm focus skin distance, fields 6 by 8 cm, 1,500 to 2,200 r units administered in two to ten weeks and the course of treatment repeated when necessary The results were satisfactory in most of the cases and proved beyond doubt that *x*-ray treatment is worth trying in these conditions

Obstetrics and Gynaecology

88 Ocular Troubles in Pregnancy

G RENARD (*Gynec et Obstet*, November, 1936, p 337) distinguishes between those ocular conditions occurring in the first four months and those, more serious, in the latter part of pregnancy Among the former slight myopia and inversion of the oculo cardiac reflex are due to the sympathetic third nerve paresis and pigmentation of the lids of the thyroid and bitemporal hemianopia to the pituitary gland In the latter group an oedema of the nerve head comes from a rise in tension of the cerebrospinal fluid, neuroretinitis with haemorrhages and exudates is due to eclampsia and is a danger signal to mother and child, resulting from the general azotaemic condition of the mother Loss of vision as well as neuroretinitis indicates a still graver prognosis This retinitis should preclude further pregnancies for some time In the last stages of pregnancy sudden detachment of the retina, often bilateral, and amaurosis usually resolve, homonymous hemianopias, scotomata, and retrobulbar neuritis also occur During delivery subconjunctival haemorrhages and pulsating exophthalmos, and after delivery optic atrophy retrobulbar neuritis, and metastatic infections, may appear

89 Mild Influenza in the Puerperium

E SCHNEIDER (*Med Welt* November 28, 1936, p 1728) states that of 1,472 puerperal cases thirty-seven developed mild influenza In twenty-one the first rise of temperature was on the sixth, seventh, or eighth day The symptoms were pyrexia up to 102 2° F, considerable constitutional disturbance, injection and soreness of the pharynx and conjunctivae, and a dry cough All the symptoms disappeared in two or three days, and no complications ensued

90 Endometriosis and Primary Abdominal Pregnancy

P VARA (*Zbl Gynak* November 21, 1936, p 2770) describes a case of primary abdominal pregnancy fulfilling Veit's conditions and associated with the presence of endometriosis in the site of its implantation The embryo was 16 mm long and the ruptured ovum was attached to the peritoneal aspect of the posterior wall of the uterus, microscopical examination showed that here the gestation sac was in organic connexion with endometrial tissue—glandular spaces lined by high cylindrical and partially ciliated epithelium, together with a collagenous stroma exhibiting decidual reaction The suggestion that primary abdominal pregnancy in the pouch of Douglas might be due to the presence there of endometriosis was advanced on theoretical grounds by Maczewski in 1926 Vara points out that in such pregnancies the common sites of ovular insertion are those in which endometriosis most often occurs—the broad ligaments, the pouch of Douglas, and the posterior uterine wall He suggests that the nodules of endometriosis form an ideal site of implantation for the ectopic ovum, and that the rarity of primary abdominal pregnancy is due to its dependence on the coincident and accidental coexistence of two rarities—the presence in the abdomen of a fertilized ovum and the existence there of a decidually reacting endometrial implant A search for endometriosis in existing pathological specimens of primary abdominal pregnancy might, it is said be instructive

Pathology

91 Leucocyte Count in Peptic Ulcer

L UGELLI (*Policlinico*, December 15 1936, p 652) states that though numerous investigators have studied the behaviour of the leucocyte count in patients suffering from peptic ulcer, no one has hitherto examined the leucocyte formula after gastric resection Ugelli records his observations on seventy-three patients with gastric or duodenal ulcer in whom he studied the leucocyte count before and after gastric resection, the intervals ranging from six months to three years In 40 per cent he found lymphocytosis associated with eosinophilia, which indicated the vagotonic constitution of these patients Before the operation various factors such as infection and haemorrhage may cause in some cases a neutrophil leucocytosis, which, however, disappears after the operation

92 Alcoholism

E POPPE (*Norsk Mag Laegevidensk* December, 1936, p 1321) gives an account of his experiences of Widmark's quantitative test for alcohol in the blood of persons brought to hospital suffering from injury following an accident Altogether 162 patients were examined, and sixty-six, or 40 7 per cent, were found by the blood analysis to have consumed alcohol before the accident This percentage is almost identical with that found in Stockholm by Hindmarsh and Linde, 41 per cent of whose patients proved to be alcohol-positive The author finds the blood test for alcohol far more reliable and accurate than such a rough-and ready clinical test as smelling the patient's breath It smelt of alcohol in all but three of the blood positive cases, the concentration of alcohol in the blood in these three cases being respectively 0 27, 0 32, and 1 27 per 1,000 On the other hand the breath smelt of alcohol in cases in which the concentration of alcohol in the blood was as low as 0 33 per 1,000 The breath did not definitely smell of alcohol in any of the blood negative cases, but in as many as twenty-three of the ninety-six patients found by the blood test to be alcohol negative doubts were expressed as to the smell of alcohol in the breath As an independent test smelling of the breath therefore cannot be considered reliable, and it is helpful only when the examiner is endowed with a discriminating and keen sense of smell, and then merely as an indication for a blood examination This is particularly valuable in hospital when the patient is suffering from an injury to the head and difficulties arise in distinguishing between concussion of the brain and severe alcohol poisoning, the manifestations of the two being remarkably similar Although none of the ninety-six patients whose blood was found to be alcohol-negative were considered after a clinical examination to be "under the influence of alcohol," there were among them as many as fifteen who were suffering from injuries to the head and with regard to whom no definite clinical diagnosis could at first be ventured (See also *Journal*, January 23, p 188)

93 M ROSENBAUM, R V HERREN, and H H MERRITT (*New Eng J Med*, November 12, 1936, p 914) record their observations on 133 cases of chronic alcoholism with acute exacerbations during which lumbar puncture was performed Abnormal findings were practically confined to an increase of pressure (in 25 per cent) due chiefly to cerebral oedema and partly to dilatation of the cerebral vessels produced by alcohol, and an increase in protein (20 per cent), possibly due to an increased permeability of the choroidal and meningeal vessels to protein as the result of injury of the vessels, parenchyma, or nerve roots by alcohol Abnormality of the cerebro spinal fluid in alcoholics therefore should suggest the possibility of other causes such as subdural haematoma brain tumour, and syphilis of the nervous system for the abnormality and only when these causes are excluded should it be attributed to alcoholism

recommendation that no whisky should be released from bond less than three years old and this was adopted in *legislation to the general* advantage of humanity

One picture of him setting forth of a morning well on in the seventies for a happy day's fishing with his two young grandsons gives an idea of the real Tom Nasmyth—a strong man dominated by a kindly heart Peace be unto him

H W WILTSHIRE M D F R C P

Consulting Physician King's College Hospital

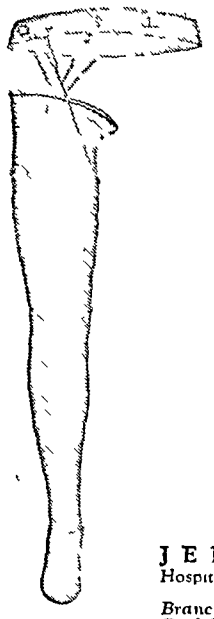
Dr Harold Waterlow Wiltshire who died on January 18 was the son of Dr Alfred Wiltshire, F R C P, and was educated at Cheltenham College and Clare College Cambridge He received his *clinical education at King's* College Hospital where his uncle the late Sir David Ferrier was a member of the honorary staff He obtained the M R C S L R C P in 1904 the M B B Ch of Cambridge and the M R C P in 1907 and the M D of Cambridge in 1910 He held the posts of house physician and house surgeon at King's College Hospital, and subsequently was appointed Sambroke medical registrar senior medical registrar, and medical tutor In 1910 he was appointed assistant physician at King's, and was promoted to full physician in 1917 In 1916 he was elected to the Fellowship of the Royal College of Physicians of London

During the great war he served with distinction in France and the Near East holding the rank of major and being mentioned three times in dispatches For his war services he was awarded the O B E and the D S O He also received the Order of St Sava of Serbia In 1919 he was appointed vice dean senior medical tutor curator of the museum and warden of the students hostel at King's and he played a prominent part in the reorganization of the teaching in the medical school For many years he was physician to the Royal Northern Hospital He was especially interested in the developments in cardiology which were then taking place and was physician in charge of the cardiological department at King's College Hospital He made contributions to the literature of many branches of medicine

Wiltshire was a keen lawn tennis player and was a *member of the team which won the Inter hospitals Junior* Tennis Cup in 1909 Unfortunately ill health overtook him, and in 1925 he was compelled to retire from the active staff On his retirement he was appointed consulting physician to the hospital and lived subsequently at Bembridge Isle of Wight He married Ellen daughter of Dr Edward Tibbits of Bradford who predeceased him *His early resignation was a great blow to King's for with* characteristic energy and thoroughness he had devoted himself after the war, in his capacity of senior medical tutor to teaching in the medical school No student ever turned to him in vain for advice or encouragement and his memory will be gratefully enshrined in the hearts of many practitioners in this country and throughout the Empire His retirement was no *less a personal blow to* his colleagues who had learned to rely on his judgement and to admire his personality and to a wide circle of patients who valued his skill and devotion

From his student days onwards Harold Wiltshire made many friends and retained them in later years He was a physician of the highest type skilled and cultured wise and understanding and a man who put *the interests of* his patients first of his students next and was only too apt to neglect his own—a fact which undoubtedly contributed to the breakdown of his health J A D

DR WILLIAM HUNTER



Mr WALTER G SPENCER writes In this country we are deeply indebted to Dr William Hunter who from 1900 was led to recognize that the glazed red tongue which accompanies the anaemia he described no longer directs attention away from the mouth but rather to it Pyogenic organisms towards middle life set up suppuration between the tooth and the soft parts of the gum and the bone of the alveolus and there is a continuous toxic absorption *which sets up* pyogenic gastritis More insidious still virulent haemolytic streptococci infect the periosteum of the gums and the tooth sockets and become the essential cause of ill health Advances in x ray photography now demonstrate the early disease at the apices of the teeth *Effects so widespread so multiple so frequent so grave*, a common source of blood infection were laid bare by Hunter and have since been continually added to What was previously obscure in the cases of insidious pleural renal endocardial arthritic and ocular affections—affections chronic and persisting in spite of other treatment—has been made clear after the judicious extraction of teeth relief has been obtained and health restored

PROFESSOR FRASER HARRIS

Dr WALTER R BETT *medical librarian Columbia* University writes Although separated by considerable difference in age I felt privileged to regard the late Dr David Fraser-Harris as one of my intimate friends With *his vivacious and friendly personality* he found it easy to extract a rich fund of interest variety and pleasure *out of life* His curiosity was insatiable his imagination lively and he carried his years with amazing indifference *The circumstances of his life enhanced his natural talent* for adapting himself with ease to the various types and *conditions of society* He knew how to be young in heart with the young serious with the learned and simple *with those eager for information* While never profound, his knowledge was extensive and bizarre It was as a popular lecturer that he excelled, for he was fluent, dramatic and entertaining

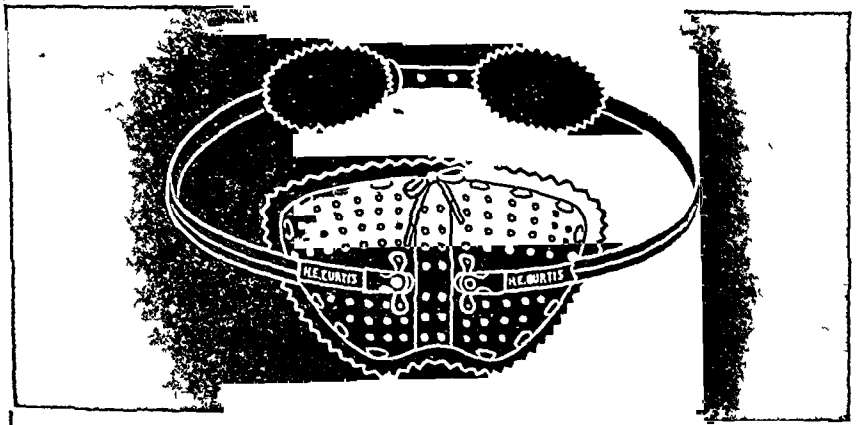
Dr W JENKINS OLIVER M R C P the son of Sir Thomas Oliver died in Newcastle upon Tyne after a brief illness He was educated at Winchester and Oxford where he graduated M A B M B Ch in 1911 and was a keen and exceptionally able dermatologist He had not, however practised in England for many years and much of each year was spent abroad in Norway and Denmark Dr Claude Lillingston has contributed the following outline of part of his career Oliver was a great little man Rumour had told me of a hermit Englishman who spent from May to October each year in an out of the way spot in an out of the way fjord on the west coast of Norway Some five years ago I ran him to earth in this spot in a Stanley greets Livingstone atmosphere His salmon fishing was so much of an avocation that I doubt if his average was one fish a month His vocation was quite another thing He had discovered *this spot before the great war* had mastered colloquial Norwegian almost to perfection and had become so much one of the peasant community in which he lived that few knew its inner life better To his keen personal interest in all his neighbours he added a medical interest and *when the local doctor took his annual holiday* Oliver was his locumtenent—much to the honour of the *English medical profession* His dry and kindly sense of humour had an irresistible appeal and was a wonderful vehicle for the sound advice he gave Doubtless his scientific gifts would sooner or later have spelt success had he remained in London as a dermatologist but his was not a conventional estimate of values and the happiness he gave and himself enjoyed in his summer home was surely success of the best His frail physique and a shoulder which went out of joint on the slightest provocation would have made a lame dog of most men but Oliver just laughed at these disabilities and made good

"Solvitur Ambulando"

The great advances in recent years in prostheses for the lower extremities are exhaustively described and extensively illustrated in a 72-page book under the above title

Copies gratis to the Medical Profession on application

This book fully describes the latest developments in mechanical technique in relation to light metal and wood artificial limbs, with descriptions and illustrations of every type of modern prosthesis for amputations and congenital deformities of the lower extremities It is the result of practical experience gained in rehabilitating over 100,000 amputees by the Hanger establishment, which is many times larger than any other limb makers in the world



This great British organisation is solely devoted to making and fitting artificial limbs It provides a Nation wide service, and in every part of the British Isles and the Irish Free State, the Medical Profession, Hospitals and amputees have at their command the best that modern science and skill can offer

himself to be a registered practitioner, for the patient had not alleged this in bringing the case. He reminded them that although the orthodox medical profession liked to think itself the sole repository of knowledge of the art of healing, there were undoubtedly unorthodox practitioners who rendered great public service. Professional osteopaths were an example and the same might be said of naturopaths who combined herbalism with nature treatment and the more reputable of them had formed themselves into associations which did their best to create standards. No one need consult these practitioners unless he liked; a patient who consulted one had the right to expect the average skill knowledge and efficiency of the body of naturopaths to which the practitioner belonged.

The jury found that Mr Foster had been guilty of breach of duty in the advice and treatment he gave Mr Sones and awarded the patient a return of £40 of the fees he had paid £50 for unnecessary pain and suffering and £400 for the loss of his knee.

DANGERS OF UROSELECTAN B

A HIGH COURT CASE

Mr Justice Finlay gave judgement on January 11 in the King's Bench Division for £800 damages and costs against a young house surgeon in an action for negligence brought by a former patient.

The man was admitted to the Manchester Royal Infirmary last February for intravenous pyelography. The surgeon had some difficulty in finding the cubital vein and when he finally injected about 5 c.cm. of a 20 c.cm. dose of uroselectan B in the left arm the patient complained of great pain. He tried to find a vein in the other arm and at the ankle and finally returned to the left arm and made another injection which also produced pain. As his arm was inflamed he consulted his own doctor who diagnosed median nerve paralysis. An operation was performed on July 3 and the nerve was found embedded in scar tissue. Witnesses put the prospect of recovery between a year and eighteen months. For the defence it was said that the doctor was the best house surgeon the hospital had had for many years. He had done about twenty-four of these injections without trouble and observed as a consequence of injecting uroselectan B out side a vein. The patient complained of pain immediately the needle was put in and when the test for patency was satisfactory the doctor proceeded with the injection. On finding a second patency test unsatisfactory he withdrew the needle and tested the other arm but could not find a patent vein and so returned to the left arm. The drug must have entered the blood stream as the skiagram was a success. Complaints of pain were frequent at these injections and he did not think that the patient's pain was due to leakage into the tissues. If he had known that the patient might have median nerve paralysis he would have made an incision.

In his judgement reserved from the December Assizes at Manchester Mr Justice Finlay said that the leakage of the fluid into the tissues was a misfortune but the injury was not one which the doctor could reasonably have anticipated. He had committed negligence however in ignoring the patient's continual complaints of pain. It was an error of judgement to treat them merely as the expressions of a hypersensitive patient but not reprehensible negligence and the doctor was unfortunate that his error should have led to such grave consequences. The escape of fluid in such large quantities could have been avoided if the doctor had paid more attention to the complaints of pain. In conclusion the learned judge hoped that the action would not affect in any way a very promising career, as it should not.

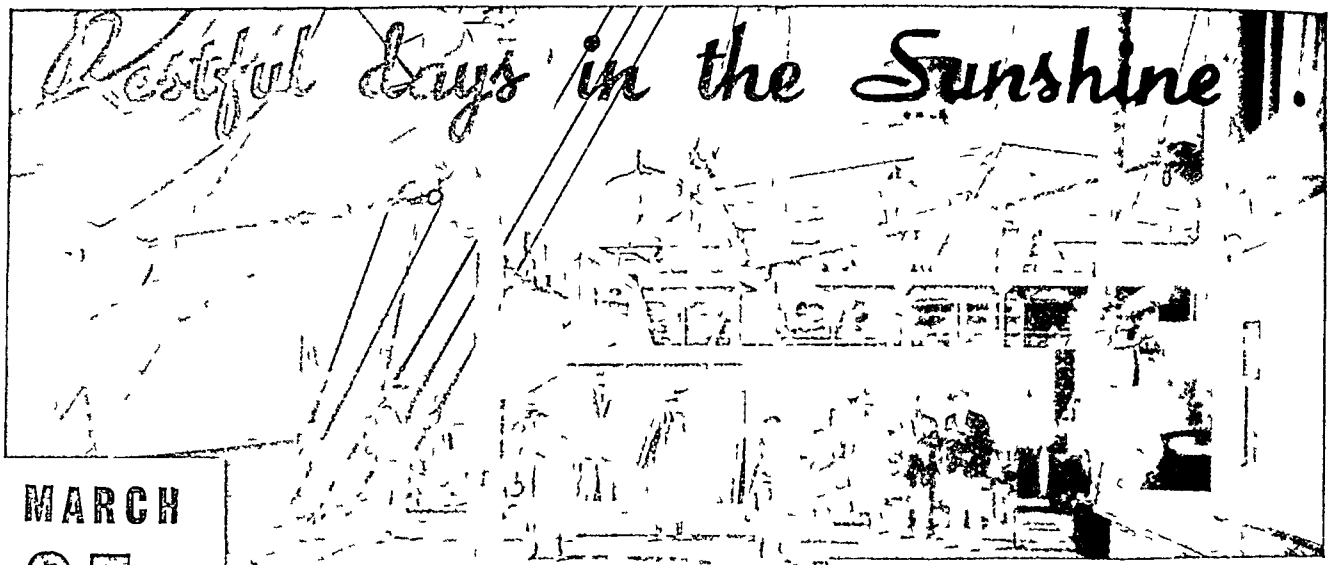
Medical men will feel great sympathy for their colleague. Uroselectan B is a pyridine derivative containing 51½ per cent of iodine in close organic combination. It must have been used in hundreds of thousands of radiographic investigations since its introduction a few years ago and although slight and transient disturbances have occasionally been noted and sometimes ulceration and sloughing median nerve paralysis has so far as we know been quite unknown. In the present case it was caused by the constriction of the scar tissue which formed at the site of the puncture. Veins are often difficult to find and painful leakage of fluid is not uncommon. If there is any lesson to be drawn from the case it is that repeated complaint of severe and continued pain must be regarded as a serious warning. The doctor seems to have been the victim of one of those rare anomalies that happen in the use even of the safest drugs.

Medical Notes in Parliament

The House of Lords reassembled after the Christmas recess on January 26 when the Lord Chancellor resumed his seat on the Woolsack after a long illness. On the same day a message from the King was read in both Houses which recommended Parliament to make permanent provision for exercise of the Royal Authority during any illness of the Sovereign or his absence from the Realm and also during the minority of a Sovereign. The message referred to the setting up of a Regency Council during the illness of King George V in 1928 and during his last illness in 1936. The Government arranged to introduce a Regency Bill in the House of Commons.

In the House of Commons the first place in the ballot for leave to move motions on January 20 fell to Mr Shinwell who proposed a resolution advocating provision of at least one meal a day for school children. The third place fell to Sir Francis Fremantle who desired to call attention to the neglect of the report of the Committee on Satellite Cities.

Wing Commander James gave notice that when the House went into committee on the Civil Estimates he would call attention to the need for implementing the report of the Brock Committee on Voluntary Sterilization. Mr Rowson proposed on the same occasion to call attention to the question of nutrition.



The Road Traffic Bill and the Inheritance (Family Provision) Bill introduced respectively by Colonel Moore Brabazon and Mr W. Windsor each received a second reading in the House of Commons on January 22.

The Unemployment Assistance (Temporary Provisions) (Amendment) Bill was read a second time on January 22. The Maternity Service (Scotland) Bill a Government measure was down for second reading in the Commons on January 28 and the Deaf Children School Attendance Bill on January 29. Other subjects discussed by the Commons this week included discharges from the Royal dockyards, Empire settlement and the new duties on foreign beef and veal. During this last discussion reference was made to the importation of liver for production of remedies against pernicious anaemia.

In the House of Commons on January 26 Mr Groves presented a petition signed by 19,515 citizens in this country asking Parliament to abolish the present power for experiments on dogs.

A circular drawing the attention of local authorities to their powers and duties under the Public Health Act 1936 in respect of offices is in preparation and will be issued well in advance of October 1 the date on which the Act comes into force.

The Government hopes shortly to lay before Parliament its proposals for national physical training.

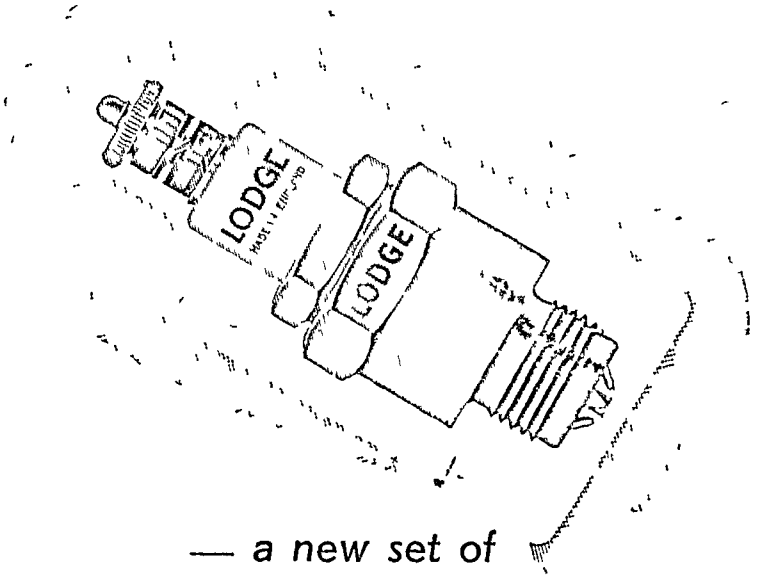
The House of Lords reassembled after the Christmas recess on January 26 when the Lord Chancellor resumed his seat on the Woolsack after a long illness On the same day a message from the King was read in both Houses which recommended Parliament to make permanent provision for exercise of the Royal Authority during any illness of the Sovereign or his absence from the Realm and also during the minority of a Sovereign The message referred to the setting up of a Regency Council during the illness of King George V in 1928 and during his last illness in 1936 The Government arranged to introduce a Regency Bill in the House of Commons

In the House of Commons the first place in the ballot for leave to move motions on January 20 fell to Mr Shinwell who proposed a resolution advocating provision of at least one meal a day for school children The third place fell to Sir Francis Fremantle who desired to call attention to the neglect of the report of the Committee on Satellite Cities

Wing Commander James gave notice that when the House went into committee on the Civil Estimates he would call attention to the need for implementing the report of the Brock Committee on Voluntary Sterilization Mr Rowson proposed on the same occasion to call attention to the question of nutrition

The Road Traffic Bill and the Inheritance (Family Provision) Bill introduced respectively by Colonel Moore-Brabazon and Mr W Windsor each received a second reading in the House of Commons on January 22



The Unemployment Assistance (Temporary Provisions) (Amendment) Bill was read a second time on January 25 The Maternity Service (Scotland) Bill a Government measure was down for second reading in the Commons on January 28 and the Deaf Children School Attendance Bill on January 29 Other subjects discussed by the Commons this week included discharges from the Royal dockyards Empire settlement and the new duties on foreign beef and veal During this last discussion reference was made to the importation of liver for production of remedies against pernicious anaemia

In the House of Commons on January 26 Mr Groves presented a petition signed by 19 MS citizens in this country asking Parliament to abolish the present powers for experiments on dogs

A circular drawing the attention of local authorities to their powers and duties under the Public Health Act 1936 in respect of offices is in preparation and will be issued well in advance of October 1 the date on which the Act comes into force

The Government hopes shortly to lay before Parliament its proposals for national physical training

Staff Accommodation at Ministry of Health—In a reply to Commander Fletcher on January 21 Sir KINGSLEY WOOD said he had from time to time received representations from the Departmental Whitley Council about the accommodation provided for the staff at the Ministry of Health Such representations were considered and where necessary brought to the notice of the Office of Works In general the accommodation in the Ministry was satisfactory About fifty to fifty five clerks spent a normal working day of about six hours for three months at a time in the basement courts which were large light and well ventilated rooms There was no overcrowding in any part of the Department Natural lighting in the rooms was generally good, and in only a small proportion was it necessary for any officer to resort to artificial light all day under normal weather conditions He was not aware of any outstanding complaints

Sight testing Opticians—Mr WALTER ELLIOT told Mr Henderson Stewart on January 22 that he had received certain representations from opticians regarding the new draft regulations as they affected sight testing opticians He had arranged to receive a deputation from Scottish opticians on this subject On January 26 Captain MACNAMARA asked the Minister of Health if he was aware of the anxiety among opticians of the country at the new draft regulations concerning the payment of their services for ophthalmic treatment and whether he would give an assurance that their position would be regularized in the new regulations so that there would be no doubt about the legality of their claim for service fees in the future Mr R S HUDSON replied that there had never been any intention of depriving opticians of a fee for services rendered by them in connexion with the supply of glasses to insured persons but some doubt had been expressed about the position under the proposed regulations The matter was receiving the careful consideration of the Minister of Health and of the Secretary of State for Scotland If they were satisfied that some modification of the wording of the draft regulations was required to legalize the payment of such a fee the necessary modification would be embodied in the substantive regulations

The Services

DADG ARMY MEDICAL SERVICES

Major G T Garraway R A M C has been appointed Deputy Assistant Director General Army Medical Services War Office

DEATH IN THE SERVICES

Lieut Colonel WILLIAM KEAYS R A M C (ret) died at Keynsham Somerset on January 14 aged 86 He was born on January 12, 1851 was educated at the Ledwich Medical School Dublin and took the L R C S I and L K Q C P in 1874 also subsequently the M R C P I in 1879 and the F R C S I in 1886 He entered the Army as surgeon on February 3 1878 passing first into Netley became lieutenant-colonel after twenty years service and retired on June 11 1904 While on the retired list he was employed at Weymouth from 1909 till 1912 He served in the Egyptian war of 1882 gaining the medal and the Khedive's bronze star and in the Sudan campaign of 1885 at Suakin when he received a clasp to the Egyptian medal When the war of 1914-18 began he rejoined for service and was employed at Bristol first on recruiting duties and later as chairman of the Pensions Board

74 Diagnosis of Hodgkin's Disease

P EMILE-WEIL P ISCHWALL and MME S PERLES (*Presse med* October 3, 1936 p 1540) emphasize the difficulty of diagnosis in Hodgkin's disease and the fact that until recently the only certain method was the biopsy of a gland The procedure is often difficult and must be carried out in hospital, and in women the removal of a gland in the neck often leaves a visible scar In other parts of the body the removal of a gland may necessitate rest in bed or immobilization of a limb As an alternative puncture of a gland is recommended This procedure is easily carried out and gives equally reliable results, particularly as several glands can be punctured simultaneously Experience is needed to recognize the characteristics of Hodgkin's disease but this is easily acquired, and the technique of puncture presents no difficulties if care is taken that the syringe and needle are suitable In twenty cases in which glandular puncture was carried out the results were confirmed by biopsy and in every case the diagnosis was found to be correct Two outstanding characteristics were observed to be typical of the Hodgkin's gland—its cellular nature and the type of cells met with such as Sternberg and endothelioid cells Four different types of glandular enlargement can be recognized from the diagnostic puncture that which shows hyperplasia of the mononuclears, the type where there is a preponderance of eosinophils, a third type where the polynuclears predominate, and lastly, the fibrous type Cases are described which illustrate these different varieties It is pointed out that puncture of a gland besides being as valuable as biopsy for diagnosis of Hodgkin's disease and much easier to carry out is also able to show the progress of the disease so that treatment may be regulated and controlled

75 Acute Meningitis in Early Syphilis

CHESTER N FRAZIER and JUI WU MU (*Chin med J* November 1936, p 1591) report that among 1 262 cases of primary and secondary syphilis seen at the Peiping (Peking) Union Medical College during seven years acute symptomatic meningeal neurosyphilis was present in 12 8 per cent—that is in 162 cases This figure of 12 8 per cent is made up of 11 1 per cent who had had inadequate arsenical treatment and 1 7 per cent who had had no arsenical treatment. The incidence of early meningeal involvement in Peking is very much greater than in America In treated cases the ratio of mucocutaneous relapse to neuro recurrence was in Peking 8 6 to 11 1 and in an American series 12 1 to 2 9 These figures seem to suggest a greater susceptibility on the part of the Chinese patient to meningeal involvement Only one patient out of 169 cases of meningitis was a female though 13 per cent of the early syphilitics were females Basilar meningitis with cranial nerve palsies was present in 162 cases *diffuse cerebral meningitis* in twenty-two cases, acute syphilitic hydrocephalus in twenty eight cases and spinal meningitis with various degrees of myelitis in eleven cases The cranial nerves most often involved were the seventh and eighth 82 8 per cent of the patients had received from one to five arsenical injections during the primary or secondary stages of their syphilis Neuro recurrences usually developed within six months of the cessation of treatment Among twenty-four patients acute meningitis developed within one month of ceasing treatment A progressive increase in the severity of the disease occurred in patients who had a series of relapses with intervening irregular treatment A high percentage of cases showed abnormalities of the cerebro spinal fluid without clinical signs or symptoms of neurosyphilis The authors think that many of these cases would not have developed clinical signs of meningitis later if they had not been subjected to inadequate arsenical treatment Results of adequate treatment of early meningeal involvement are good with the exception of deafness due to eighth nerve lesions The necessity for full courses of arsenicals and bismuth is stressed Therapeutic shock in the treatment of early neurosyphilis is not recommended

76 Allergy in Rheumatism

A GERONNE (*Dtsch med Wschr* October 23 1936 p 1745) who is in charge of a municipal hospital in Wiesbaden finds in the leucocyte count confirmation of his belief that certain of the manifestations of rheumatism are allergic reactions During the past year one of his assistants has undertaken eosinophil counts in every case of rheumatism and has avoided confusion by excluding from the study cases of lead poisoning and worms in which the eosinophil count might conceivably be abnormally high The total of 254 well established cases of rheumatism included sixty-four of primary chronic arthritis seventy seven of secondary chronic arthritis twenty four of myalgia and forty three of neuralgia which in most cases took the form of sciatica There were several cases of acute articular rheumatism and of arthroses but only two cases of genuine gout in this material In as many as eighty six of these 254 cases *the eosinophil count* was over 4 per cent which is in the author's opinion the *upper limit of a normal eosinophil count* What impressed and surprised him was to find high eosinophil counts in practically every category, whether the patient was suffering from acute articular rheumatism myalgia neuralgia or any other manifestation of rheumatism One of the therapeutic lessons the author extracts from these findings is that the rheumatic patient requires to be very gradually and carefully desensitized, at present the injections given to induce a stimulating Reizkorpertherapie are apt to be much too heroic, the doses being too large and their spacing too short The violent reactions provoked by large doses of gold preparations for example are to be deplored the sufferer from myalgia, neuralgia, arthritis etc being in need of rest in the allergic sense, not stimulation

Surgery

77 Peripheral Neurectomy for Thrombo angiitis Obliterans

ROVIRALTA (*Paris med* November 28 *1936 p 395*) states that lumbar sympathectomy was first carried out for Buerger's disease in 1924 Later removal of the suprarenal gland was advocated for this disease both these operations carry *with them an appreciable* mortality It is suggested that resection of the nerve trunks at a level which *does not interfere* with the function of the limb itself may be a valuable procedure Several cases are reported in which this operation was carried out for ulcer of the toe or hand due to thrombo angiitis obliterans In most cases there was evidence of intermittent claudication and intense pain in the affected part. Usually the patients were between the ages of 20 and 40 and had often been bedridden for several years Sympathectomy where this had been carried out had had little or no effect on the condition In the first case which was typical of the series, resection of 4 cm of the posterior tibial nerve and

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON. THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT, M.A., M.D.

The registered Hospital is situated in 120 acres of park and pleasure ground. Voluntary patients who are suffering from incipient mental disorder or who wish to prevent recurrence of mental trouble, temporary patients and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examination. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorder. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical baths, Plombières treatment etc. There is an Operating Theatre, a Dental Surgery, X-ray room, an Ultra-Violet Apparatus and a Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The Wayside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North West side of the Estate a mile of coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer period. The Hospital has its own private bathing house on the shore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket ground, football and hockey ground, lawn tennis court (grass and hard court), croquet grounds, golf course and bowling green. Ladies and gentlemen have their own gardens and facilities are provided for handicraft such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

NORTHUMBERLAND HOUSE,

Extract from Review of the Previous Edition

This is essentially a practical work. Although a little stress is laid on the theoretical aspects of the subject, the bulk of the book is devoted to a description of the methods of diagnosis and treatment that have been found by experience to be the most satisfactory. The stock of material at the Edinburgh Royal Infirmary [illegible] than that of most hospitals, and the methods of treatment that he advocates have been tested by experience and found [illegible]

We have no hesitation in saying that Practical Methods in the Treatment of Venereal Diseases is the best book of its kind in this country. In the reviewer's opinion it is the best [illegible] published during the last ten years. None of them has the merit of presenting in so small a compass so much practical information. *—Dublin Medical Journal*

BED DAMPNESS BANISHED

The only practical remedy against damp cold beds is the 'Thermega' Electrically Heated Blanket. It drives the damp out.

The Thermega is already in use in many Hospitals and Nursing Homes—providing warm beds for operation and accident cases. It is safe and reliable. Thermostatic control prevents overheating. Consumption averages 16 hours per unit. 3 heat Electric Pads for Local application for relieving all pain.

'Insist on Thermega.' It is vital that these appliances should be made by experienced manufacturers.

At all good stores chemists electricians or write to Thermega Limited, 51/53, Victoria Street, London, S.W.1

Blankets from 3 gns. Pads from 31/6
3 Temperature Blankets for medical use £8 10s
Single-heat Blanket with special backing to give extra strength from £4 4s. Various sizes and prices on application

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duo-Ray" Apparatus
AS USED IN THE TEACHING HOSPITALS

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS SCIATICA LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED, THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use, and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

OVOFERRIN

BRAND COLLOIDAL IRON TONIC

the rapid blood builder

It is estimated that the amount of iron in the entire body is not more than 3 gm. When this small supply is diminished serious consequences develop. Essential iron lost through haemorrhage, deficient food iron or other causes is quickly replaced by Ovoferrin.

While all forms of iron are beneficial in anæmia it is equally true that Ovoferrin presents the iron in a form that eliminates all the undesirable qualities of non-colloidal iron.

Ovoferrin has unique advantages. It is a rapid blood builder; it does not stain the teeth; it has an agreeable taste; it is odourless; it is not astringent; it does not constipate; it stimulates the gastric appetite; it is tolerated by the most sensitive stomach; it is a wonderful tonic for children.

Ovoferrin is all the vitamin-free therapeutic iron without any of the disadvantages.

The adult dose is a tablespoonful in wine, juice of milk or water before meals. Ovoferrin contains 10 grains of metallic iron in colloidal form. Tell me that the Ovoferrin specified in Dr. Brine's bottle.

If you have not tried Ovoferrin in your practice we shall be pleased to send you a trial bottle on request.

Adexolin—standardised concentrates of vitamins A and D

The A and D barrier to Infections

PROPHYLAXIS. One to three Adexolin Capsules daily. Children 1 capsule or 20 drops of the liquid. Infants 2 drops in each bottle feed or 10 drops a day in fruit juice. TREATMENT. At the outset of an infection 4-5 Capsules (or 80 to 100 drops of the liquid) daily. In acute infections up to one capsule (or 20 drops) every waking hour may be given.

A sound nutritional barrier to infections may be built up by the administration of Adexolin concentrates of vitamins A and D—1. To fortify the epithelium and help to maintain general resistance. 2. To regulate calcium and phosphorus metabolism. Adexolin is also valuable by virtue of its effect on the general well-being. In principle it may be said that Adexolin treats the patient while specific remedies treat the disease. The concentration of the two vitamins in Adexolin has been specially calculated to make possible the utmost flexibility of dosage.

The old way—Using the bee itself

The new way—With Forapin Salve

Bee Toxin in the treatment of Rheumatism

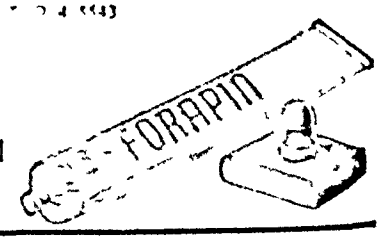
The chief advantages of this preparation in salve form are —

1 The application of bee toxin in the form of an ointment is at least equal in its effects to the older method

2 It is simple and almost painless to apply and may be prescribed for ambulatory cases without any constant medical supervision

3 It is possible to introduce the large amounts of toxin necessary in chronic cases without resulting in any considerable pain

Tubes
Forapin I Normal
Forapin II Strong (in obstinate cases)



The toxin is also available in ampoules for intramuscular injection

FORAPIN

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza: the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of coryza and influenzal infections. It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd. This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products. A copy of the brochure will gladly be supplied to any physician on request

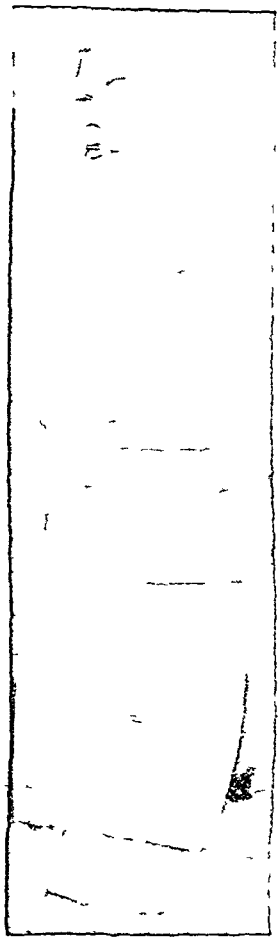
IN DISPLACEMENTS OF ABDOMINAL VISCERA Where Support is Needed

Spencer Supports gain patients' appreciation by providing exact fit, restful comfort and the correct design for the condition

For such cases a Spencer Support is an accepted corrective measure It affords relief by supporting the organs as nearly as possible in normal position and in effecting a marked posture improvement

Each Spencer Support is a special creation designed and made from the actual measurements and posture description of the individual patient It unites accepted surgical principles and a style corset which ensures the best possible figure lines saving the patient the expense of purchasing two garments Therefore it is practical as well as economical to prescribe a Spencer



The weight of the abdominal support in a Spencer is always on the pelvic girdle not on the spine at or above the lumbar region Its exact fit anchors the garment securely to the patient's figure so that it will not ride up or slip out of place

Spencer Supports are individually designed for Breast Conditions Hernia Sacro iliac Strain Enteroptosis and Intestinal Stasis Movable Kidney *Pregnancy and Postpartum Support*

They are exceptionally light in weight flexible easily laundered and guaranteed NEVER to lose their shape

A scientifically trained Spencer Corsetiere will call at your surgery or at your patient's home to take measurements under your supervision

Spencer Supports and Corsets are never sold in shops.

Spencer Supporting Corset The three tapes at the side provide adjustment of the inner abdominal belt entirely independent of the corset section

SPENCER
made REJUVENO patented
FOUNDATION GARMENTS AND SURGICAL SUPPORTS

BEWARE OF SUBSTITUTION—Spencer Corsets Ltd regret the necessity of warning the medical profession that in several instances where doctors have specifically prescribed a Spencer Support a corset of another make has been substituted and because its makers do not understand the Spencer principles of individual designing has been unsatisfactory *Every genuine* Spencer Support bears the SPENCER Label

For Effective Control of Pain

AMONG the many and diverse analgesics which have been evolved by modern chemical research acetyl salicylic acid retains its reputation as one of the safest and most effective. Its tendency to liberate salicylic acid—the irritant properties of which are well known to physicians—has however caused many to hesitate to employ it as widely as it deserves. Exhaustive trial in hospital and private practice proves that Alasil definitely solves the problem of administering acetyl salicylic acid in an effective form being free from the risk of irritating the stomach or bowels or of causing general reactions.

A supply for clinical trial with full descriptive literature sent free on request

In 'Alasil' the desirable therapeutic effects of acetyl salicylic acid are well exhibited by its calcium acetyl salicylate moiety while the presence of 'Alcol' (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid obviates any tendency to gastric irritation. The superior absorbability of 'Alasil' over ordinary salicylate compounds and its freedom from the risk of liberating free salicylic acid in the stomach have been well proved by careful experimentation. 'Alasil' can be prescribed with perfect safety to patients of all ages and in larger doses than ordinary salicylate compounds.

MIL-SAN

The Scientific Contraceptive

. . . its non-toxic character

It is taken as an essential by the producers of MIL SAN that a contraceptive which members of the medical profession can prescribe with confidence and the public use with safety must be non toxic.

There must be no danger of toxic disturbance by absorption even over a long period of use Likewise, it must not contain any ingredient which would be unsafe if it fell into the hands of children or persons ignorant of its purpose

This automatically rules out arsenical, mercurial and quinine compounds and derivatives The gynaecologists who conducted the researches and tests were familiar with cases of toxic disturbances caused by these ingredients while instances were known of fatalities due to the accidental misuse of poisonous compounds

MIL SAN contains no poison and can occasion no toxic disturbance Its contents are set out in the literature sent on request to all interested members of the medical profession

MIL SAN is non injurious is immediately effective independent of temperature moisture or foaming and is simple and hygienic to use In manufacture packing and application, there is no contact with metal thus all contamination with metallic salts is avoided.

The MIL SAN method of application by means of ready filled single application tubes is simple ensures the quantity, maintains hygienic conditions and is proof against carelessness

Specimen tubes are sent to members of the medical profession on request.

In Hyperacidity, Dyspepsia *and related conditions*

A finely-divided powder containing six valuable digestive agents, 'BiSoDoL,' the balanced antacid digestant, has a formula designed not only to relieve discomfort immediately, but to correct any disturbance in the acid-base balance of the body. It is indicated in hyperchlorhydria, dyspepsia of pregnancy, and most of the functional and organic disorders of the stomach—and their sequelae.

The diagram indicates some typical sites and relative frequency and size of gastric and duodenal ulcers for which BiSoDoL is especially indicated

'BiSoDoL' CONTAINS—

BISMUTH SUBNITRATE
Now recognized as one of the most efficient antacids for relieving pain, it has a complete control of the gastric acidity immediately.

SODIUM BICARBONATE
For the purpose of providing immediate relief from acidity and flatulence. This ingredient acts in conjunction with—

MAGNESIUM CARBONATE
An insoluble substance which holds acidity at an optimum. It acts as a buffer and is valued for treatment in cases of recurring acidity.

PAPAIN
[illegible]

DIASTASE
[illegible] which completes the digestion of starchy foods.

PEPPERMINT OIL
For its carminative action and to make the preparation palatable.

Because of its balanced combination of ingredients, 'BiSoDoL' avoids the usual dangers of intensive alkaline treatment and has no contra-indications. For patients requiring 'BiSoDoL' adapted for use in convenient tablet form, 'BiSoDoL MINTS will provide an effective alternative. 'BiSoDoL constitutes a remarkable advance in the treatment of all disorders of the stomach.

Samples and literature will gladly be sent to the Medical Profession upon request

A SOLUTION TO AN AGE-OLD PROBLEM

'When purgatives are conveyed to the stomach and are there dissolved, they are carried by the same passages as the food, and when they cannot be digested but their prevailing power remains unsubdued, they return and carry with them whatever opposes them, and this is called purging'

Aristotle Problem 43
(Quoted by Paul of Aegina)
384 322 B C

The abuse of purgatives was fully understood centuries ago, but the medicaments available were limited in number The treatment of constipation was a difficult problem

Constipation may now be treated in the modern way by the use of 'Petrolagar,' which, by mixing intimately with the intestinal contents, provides a soft faecal mass which is easily evacuated by normal peristalsis 'Petrolagar' emulsion also has an emollient soothing action on inflamed mucous areas and for this reason is invaluable where spastic bowel or colitis is present

'Petrolagar' is extremely pleasant to take and may be diluted with water, milk or fruit juice if desired For the convenience of the medical profession it is dispensed in four varieties

1 Plain
2 With Phenolphthalein
3 Alkaline
4 With Cascara

ANAHÆMIN B.D.H.

in pernicious anæmia

According to a recent report (Lancet, December 26, 1936, p 1513) the power of Anahæmin B D H to cause blood regeneration in pernicious anæmia exceeds even that of the original product (see report of the Medical Research Council, 1934-1935 page 16), the daily injection of so little as one-twenty-fifth of 1 c c producing a rapid increase in the red bloodcount

In average cases of pernicious anæmia, however the treatment recommended is to give an initial dose of 2 c c of Anahæmin B D H followed by 1 c c at 10-day intervals until the bloodcount has remained normal for at least a month In maintenance the routine treatment is to inject 2 c c monthly, but, if desirable, the interval between injections may be as wide as two months provided 5 c c are injected on each occasion

Besides being submitted to clinical trial, every batch of Anahæmin B D H is required before issue to pass stringent biological chemical physical and bacteriological tests

The depletion of bodily reserves associated with Epidemics

INFLUENZA, Measles and Whooping-cough, are specially dangerous on account of the high attendant risk of pulmonary sequelæ, such as pneumonic and tuberculous invasions

Such complications can be largely prevented by maintaining the weight and the vitality of the patient with readily assimilable nutriment, both during illness and in convalescence

The value of Virol during an epidemic period (Feb 21—May 15, 1935) is conclusively demonstrated by the following abstract of a recent investigation* into the supplementary feeding of children —

Supplement to normal diet	Total gain in twelve weeks (ozs.)	Average gain per child per week (ozs.)
None	79	0·55
Cod Liver Oil	234	1·6
Halibut Liver Oil with milk	279	1·9
VIROL	526	3·6

The ease with which the constituents of Virol are assimilated, and the physiological balance existing between them afford a ready explanation of these important results

VIROL

*Full Report as published in "The Medical Officer," will be sent on application to Virol Ltd., Ealing, London, W 5

VIROL—In Jars, 1/6 & 3/6, ½ gall 15/-

subdural haemorrhage, and that such haemorrhage is not infrequently *bilateral* In this case there was an interval of four or five weeks before signs of paralysis appeared, but the man had never been well since his accident

The second case I want to mention occurred in a young man who crashed on a motor bicycle It was a very serious accident The pillion rider was killed and my patient lost a leg and was concussed He recovered from the amputation, but continued to suffer from headaches The accident occurred in August, and in November I was asked to see him as his headaches were still severe I could find no signs of abnormality of the nervous system, but sent him into hospital for observation

He improved very much in hospital under no particular treatment beyond rest in bed and one lumbar puncture for diagnostic purposes The cerebro spinal fluid was normal but under increased pressure (200 mm) At the end of December the severe headaches returned and he developed papilloedema first in one eye, then in the other

A diagnosis of chronic subdural haematoma was made and Professor Ross did a bilateral ventricular puncture, as there was nothing to show which side the haematoma was on No fluid could be obtained from the right lateral ventricle, the left was found easily We concluded the haematoma was on the right side, a bone flap was made, the haematoma found and evacuated, and the man made a good recovery

In this case a period of four months had elapsed between the date of the accident and the development of definite signs of compression which the appearance of bilateral papilloedema indicated In the circumstances the symptoms due to subdural haematoma might have been mistaken for those of so-called traumatic neurasthenia The cases illustrate the importance of keeping patients who complain of recurring headache after a severe or even slight concussion under close observation It is essential to examine the eye grounds regularly in order to detect the first signs of papilloedema in cases of this kind And it is important to note that several weeks may elapse before anything of the sort appears

The pathology of this condition is remarkable A membrane develops round the extravasated blood in the subdural space This membrane becomes vascularized, and a slow oozing of blood appears to occur, as a result of which the haematoma gradually increases in size and so comes to produce a slowly increasing compression of the brain

As the result there is a latent period between the date of the injury and the development of obvious signs of compression This latent period may vary in duration from a few weeks to a few months During the latent period the patient is likely to exhibit symptoms which may be mistaken for those of traumatic neurasthenia Of these symptoms headache, irritability lack of concentration, and some memory defect are the commonest

In cases where the clinical picture of haemorrhage is complicated by contusion or laceration of the brain the essential sign to watch for is that of cerebral compression

In the earlier stages, after the initial period of shock, this is characterized by headache, vomiting, a full bounding pulse, and rising blood pressure There may be signs of cerebral irritation either in the form of restlessness delirium, or excitement, or perhaps by the occurrence of convulsions As the compression increases the patient becomes unconscious (if he has previously been conscious), the pupils dilate, breathing becomes irregular or Cheyne-Stokes in character, the pulse, which was full and slow, becomes feeble and rapid, and the blood pressure, which rises in the earlier stages of compression, will fall, and if the condition is unrelieved death will follow

It is important, therefore, to keep a close watch on the pulse rate and blood pressure Lumbar puncture should be done, and the pressure of cerebro spinal fluid measured Any figure above 150 mm indicates an increased intracranial pressure and sometimes the pressure will be found to be as high as 300 mm or even more Rawling lays stress on the temperature chart, regarding a rising temperature as of serious significance

Leaking Cerebral Aneurysm

Let us next consider haemorrhage outside the cerebral substance occurring as the result of disease processes The commonest of these though fortunately none are very common is subarachnoid haemorrhage coming from a leaking aneurysm Haemorrhages may occur under other circumstances such as in the leukaemias, in purpura, and sometimes in septicaemia, but aneurysm is without doubt the commonest cause

Cerebral aneurysms occur almost entirely in the vessels which constitute the circle of Willis or its branches, and therefore lie outside the brain substance They may be the result of various morbid conditions, but the congenital aneurysm is the commonest These aneurysms arise at the bifurcation of the arteries Microscopical examination shows that the muscular coat of the artery is defective in such cases at the arterial bifurcation, which allows of the formation of the aneurysms The aneurysms so formed are usually small The name "berry aneurysm" has been given them They may be multiple Other causes of aneurysm of the cerebral arteries are arteriosclerosis and syphilis, though the latter are rare Infective endocarditis produces mycotic aneurysm as the result of embolus Trauma may also produce an arterio-venous aneurysm usually from injury to the internal carotid artery in the cavernous sinus

It is quite impossible as a rule to diagnose with certainty the presence of an aneurysm of a cerebral artery previous to its rupture or leaking from the clinical symptoms alone *X*-ray photographs will sometimes show concentric circular shadows of calcified material in the wall of the aneurysm which are known as Albi's rings Where an aneurysm is suspected the injection into the internal carotid of thorotrast, followed immediately by x-ray photography, will show this substance within the arteries, and in this way the presence of an aneurysm may be detected

Subarachnoid haemorrhage from aneurysms seems *to me* to be commoner nowadays than when I was a student and house-physician thirty years or more ago, but I suppose the true explanation is that we are now more on the look out for such cases The symptoms of a leaking cerebral aneurysm are usually dramatic The patient calls out in pain and may then fall unconscious, indeed, the diagnosis is often made on the history of a cry of "Oh! my head!" followed by unconsciousness This diagnosis will be confirmed by finding uniformly bloodstained cerebro spinal fluid if lumbar puncture is performed within a day or two of the accident after which date the fluid becomes straw-coloured If there is any doubt as to whether the blood is the result of the lumbar puncture this can be cleared up by collecting samples in two or three test tubes and comparing the tint in each On standing the supernatant fluid will be yellow-tinted in subarachnoid haemorrhage, but colourless in cases of traumatic puncture An interesting point to remember is that the urine often contains a heavy cloud of albumin for twenty four hours or so after subarachnoid haemorrhage If the patient is found unconscious this may suggest uraemia, but examination of the cerebro spinal fluid will clear up

Just a year ago Lederle introduced—

GLOBULIN Lederle MODIFIED

ANTITOXINS

IT HAS BEEN A YEAR of appraisement and ever increasing usage

The Globulin Modified *Lederle* technique, embodying the principle of peptic digestion is the only practical procedure which permits such a high degree of concentration of antitoxin and reduction in the amount of troublesome proteins—the cause of serum reactions

That is why Globulin Modified Antitoxins *Lederle* represent

- *a reduction in the expected incidence and severity of serum disease*
- *less inconvenience to the patient*
- *a greater ease of administration*
- *a great economy of space*

At one of the outstanding hospitals 250 patients treated with a Globulin Modified Antitoxin showed a serum disease rate of less than 5%—all indicating a delayed type of serum reaction

Comparison of Lederle's old antitoxins with theretofore Globulin Lederle Modified —Diphtheria Tetanus Scarlet Fever Erysipelas

Globulin Modified Antitoxins Lederle are equally available also for Gas Gangrene and Tetanus Gas Gangrene

brain will usually have given some signs of its presence before causing a sudden exacerbation, but disseminated sclerosis is a more difficult thing to exclude It is well known that the first onset of this disease may be by the appearance of hemiplegia Serological tests will establish the diagnosis in syphilitic disease, and the proof should be obtained immediately as energetic anti specific treatment will do much to improve the condition in syphilitic thrombosis

Thrombosis is also likely when arterial disease is associated with low blood pressure It is strongly suggested when the attack occurs during sleep, or following exhaustion or in debilitating conditions generally Often there are premonitory symptoms, such as numbness, tingling and temporary loss of function, such as aphasia, monoplegia, and so on But with regard to these I must point out that they may happen when the blood pressure is unduly high and as the result of temporary angiospasm in the arteries, and so these attacks may be followed either by thrombosis or by haemorrhage They are always of serious import

Of cerebral haemorrhage it may be said that it is uncommon with low blood pressure, and that usually the pressure is high, but it may not be excessively high, that it is more likely to take place during the day than the night, or in association with effort or strain, and that it is almost invariably accompanied by vomiting

Of the three embolism is most sudden in its onset and thrombosis likely to be least Consciousness may be lost as the result of any of the processes we are considering, provided the initial lesion is severe enough It is probably true to say that it is more likely to be lost early in haemorrhage than in thrombosis, and early loss of consciousness which is prolonged almost always indicates a severe haemorrhage The cerebro-spinal fluid in a serious haemorrhage is apt to contain blood, and it is good practice to do a lumbar puncture in any case of apoplexy with loss of consciousness, as it tends to lower the intracranial pressure

Convulsions at the onset of apoplexy indicate irritation of the cortex, and are more commonly due to thrombosis than to embolism, though they may occur in the latter They are very unusual at the onset of a cerebral haemorrhage

Severity of the Lesion

The severity of the lesion can be estimated from consideration of three circumstances the depth of the coma, the degree of depression of the nervous system which has followed the apoplexy, and the condition of the respiratory centre

The depth of coma can be roughly estimated by seeing whether the patient responds to any cutaneous irritation This may also serve to show the affected side if this is in doubt The depression of the nervous system can be estimated by observing whether there is a complete flaccid paralysis of all the limbs with loss of reflex action If plantar reflexes can be obtained both are likely to be extensor at this stage It is important to remember that even where the depression of the nervous system is not extreme retention of urine is common, and that it is important to prevent over-distension of the bladder

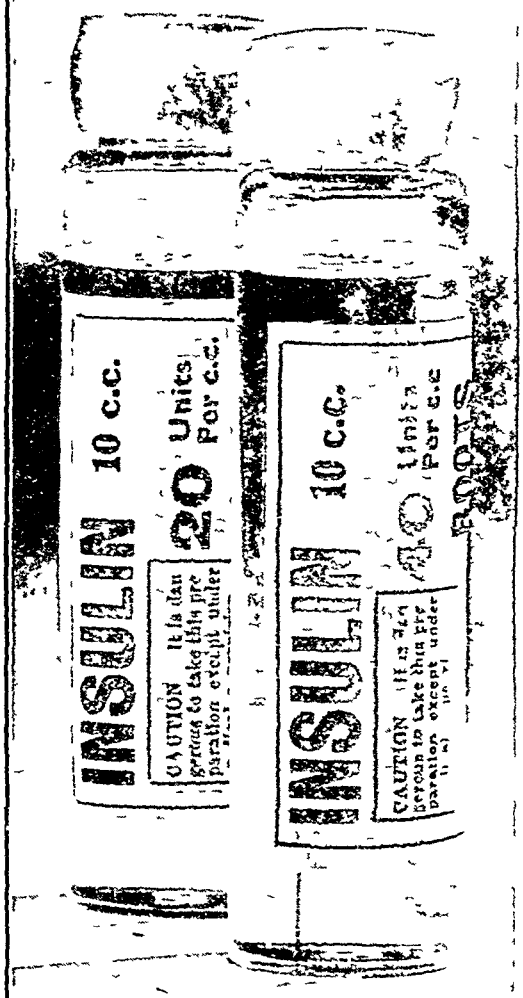
Breathing is apt to be noisy and stertorous in proportion to the severity of the lesion and grouped respiration of the Cheyne-Stokes type is a sign of failing activity in the respiratory centre

The area of the brain supplied by the middle cerebral artery is the seat of election for all forms of apoplexy, but while it is most unusual for embolism to occur elsewhere haemorrhage occasionally does so, and thrombosis more often still

Prognosis in Apoplexy

In any case of apoplexy a prognosis will be anxiously sought by the relatives of the patient The answer must deal with the immediate question of survival and the ultimate prospects of recovery of function If the patient is deeply unconscious and clearly suffering from a cerebral haemorrhage a bad prognosis must be given Such a patient will not survive And in any patient in whom unconsciousness persists over twenty-four hours the prospects of survival are poor, and if survival occurs the chances of any useful recovery of function in the affected limbs are practically *nil*

In elderly people the condition of the lungs, the heart and the kidneys must all be considered carefully in coming to any conclusion as to their survival So too must the condition of their arteries and their blood pressure One must be very guarded in estimating the prospects of recovery of function during the early stages If recovery of useful function is going to take place it will show signs of doing so at any rate by the end of a week Quite obviously the sooner some recovery of power is noted the better the prospects Cases of syphilitic thrombosis have probably the best chance of recovery if anti specific treatment is efficiently carried out



In thrombosis particularly and in embolism to a less extent, one must remember the possibility that fits affecting the paralysed side will occur These are as a rule infrequent and may cease after a time A patient whom I had under close observation for more than six years suffering from a severe thrombotic hemiplegia started to have unilateral fits affecting the paralysed limbs nine months after his apoplexy These continued at intervals of six weeks to two months for about eighteen months after which they ceased entirely

---

P Haupstein (*Dtsch med Wschr*, August 28 1936 p 1417) has conducted at the University Maternity Hospital in Freiburg i Br clinical investigations of the action on dysmenorrhoea of finely powdered potentilla anserina whose popular name in Germany is "Gansefingerkraut or Gänsekraut" Its medicinal properties were exploited in the Middle Ages, and pharmacological justification for its prescription as an antispasmodic was provided in 1933 (*Zbl Gynak*, Nr 37) by Schneider and Nevinny, who found it capable of relieving the barium cramp induced in the muscles of rabbits and rats The author gave it in the form of capsules, each of which contained 0 5 gram of the finely powdered drug From one to three capsules were given by the mouth three times a day while menstruation was painful and for two to three days before it was due Even when large quantities were taken no gastric disturbances were observed but it was found well to warn the patients against chewing the capsules on account of the disagreeable taste of their contents The complete harmlessness of the drug and its cheapness combined with the relief of pain it affords, make it, in the author's opinion, a valuable remedy Though he does not state the actual number of cases thus treated, he says that about two-thirds of his patients were under the age of 30, and that only those patients were thus treated who came to hospital complaining of severe dysmenorrhoea which, in many cases, had hitherto entailed rest in bed during menstruation The results were most satisfactory in essential dysmenorrhoea associated with anatomically normal conditions or with hypoplasia of the uterus But even when the dysmenorrhoea could be traced to chronic inflammation or displacements of the uterus the results were so encouraging that the author recommends further investigations also in this field

performed The child, aged 4 years, was very toxic, and died in spite of the administration of 100 000 units of antitoxin The strain in this case was Type IV The other cases, due to Types I and VII respectively, were haemorrhagic and very toxic

The severe cases include seven laryngeal, of which five were due to Type I and two to Type IV Of the remaining four severe cases three had palatal paralysis and one

TABLE II—*The Distribution of Types of C diphtheriae in Relation to Clinical Severity*

Type of Case	Type I	Type VII	Total—Types I and VII	Type III	Type IV	Total—Types III and IV	Total Cases
Very mild	26	5	31 (76%)	4	6	10 (24%)	41
Mild	14	5	19 (70%)	2	6	8 (30%)	27
Moderately severe	8	0	8 (57%)	0	6	6 (43%)	14
Severe	10	1	11 (78%)	0	3	3 (22%)	14

was haemorrhagic and very toxic It is thus seen that severe toxaemia was not common There was no evidence of gravis strains being associated with more severe cases of diphtheria, but the small number of such cases rendered the figures too few for definite conclusions to be drawn

The predominant strains of *C diphtheriae* were found to be of Types I and VII (70 per cent) The majority of the cases were clinically mild These findings are in agreement with those of workers in other areas regarding the association of mitis strains with a mild type of diphtheria It is interesting to note that no strain of Type II (intermediate) was found

Discussion

In 1931 Anderson and his co-workers classified the Leeds strains of *C diphtheriae* into three groups—'gravis,' 'mitis,' and intermediate" Only a small percentage failed to fall into these groups Other workers have found aberrant strains ranging from 1 5 per cent in Manchester (Robinson and Marshall, 1934) to 31 5 per cent in Staffordshire (Menton Cooper, Duke, and Fussell 1933) The possibility therefore arises that the aberrant strains of one locality may be present in considerable numbers in another The introduction by Wright and Christison (1935) of the numerical system of typing, with its possibility of expansion adds considerably to the ease of classifying such strains Thus of 109 strains isolated from clinical cases of diphtheria in Capetown only fifty-six could be clearly classified as mitis or as gravis leaving fifty-three which would have to be classified as atypical under the scheme of the Leeds workers Under the classification of Wright and Christison twenty four of these strains could be placed in the Type IV group—the non-starch-fermenting, virulent gravis type Such forms have been found in other areas only in small numbers—for example, 3 4 per cent in Edinburgh (Wright and Christison, 1935) Of the remaining strains fourteen were placed in the newly introduced group of Type VII—mitis colony starch fermenting, and virulent

Since the introduction by Anderson and his co-workers of the three types—gravis mitis, and intermediate—the stability of their major characteristics has been questioned Cultural characteristics in broth have been found an unreliable criterion Regarding colonial form, Christison (1935) found that the three types underwent marked variation *in vitro* She stated that gravis strains fermented starch irrespective of their colony structure, whereas the intermediate and mitis and their variants failed to do so She suggested that starch fermentation was a more reliable criterion than colony form for identifying the gravis type Other workers have also maintained this position

This view seems no longer tenable, since Wright and Christison (1935) found 14 3 per cent of Edinburgh strains in Types IV and VI—that is, gravis in colony form, yet non starch-fermenting Others have included similar strains in their atypical group Anderson and his co-workers (1933) report the loss of starch fermentation by one strain of gravis type on subculture, and recently Muir (1936) has found that the ability to ferment starch is not firmly fixed in some strains It is therefore of interest to note that of the 109 strains isolated in Capetown 22 per cent have been found to be of gravis type in colony form and growth in broth yet not to ferment starch or glycogen, and 12 9 per cent of the mitis type in colony form and growth in broth, yet to produce definite fermentation of starch and glycogen

Summary

1 Of 109 strains of *C diphtheriae* from clinical cases of diphtheria admitted to the Capetown City Hospital 53 2 per cent were Type I none of Type II 6 4 per cent Type III 22 per cent Type IV, 0 9 per cent Type V none of Type VI and 4 6 per cent unclassified An additional type (Type VII) was introduced since 12 9 per cent were of mitis type in colony form and in growth in broth but fermented starch and glycogen

2 The mildness of diphtheria in Capetown was in agreement with the predominant strain being of the mitis type The sparsity of severe cases of diphtheria made the figures too few to correlate gravis strains with the severity of the disease

3 An interesting feature of the findings was the comparatively high percentage of strains of Type IV—namely the non-starch-fermenting, virulent gravis type and of Type VII, the starch-fermenting, virulent mitis type

My thanks are due to Professor W F Rhodes of the Government Laboratory Capetown for supplying me with cultures to Drs J F Wicht and C K O Malley for allowing me access to the records of the City Hospital Capetown to Dr H J Parish of the Wellcome Physiological Research Laboratories Beckenham for testing some of the strains, and to Mr Stewart and Mr Mawtham for technical assistance

R W Huntington jun and D Wilkes-Weiss (*J Pediat*, October, 1936, p 449) record their observations on fifty four cases of influenzal meningitis admitted to the St Louis Children's Hospital from 1918 to 1935, during which period there were 160 cases of meningococcus meningitis seventy-four of streptococcus meningitis sixty two of pneumococcus meningitis, and twenty two of staphylococcus meningitis admitted to the same hospital Only sixteen were females and only twelve over 2 years of age, the oldest being 13 years and the youngest 2 months Three of those who were over 2 years of age recovered The onset was usually primary, but in ten the onset was preceded by otitis or pneumonia and in others there was a history of trauma The average duration of the disease was fourteen days Serum treatment was used in fifteen cases but only one recovered

PNEUMONIA

P.S.I. VACCINE EVANS

(WYNN'S FORMULA)

P S I Vaccine (Evans) is made to the formula of W H Wynn, M D, F S C, F R C P *vide* B M J, December 22nd, 1934, 1159)

Formula —	*Pneumococci*	200 *million*	*per cc*
	Streptococci	200 ,,	
	B influenzae	200 ,,	

The dose for an adult is 1 cc When given during the first 24 hours of the disease the temperature usually falls within the next 24 hours If no result follows, the dose should be repeated each 24 hours up to three times

The dosage for children is proportionately smaller but, even at 12 months, 20 million of each organism should be given

The outcome in pneumonia is largely decided during the first 48 hours and specific treatment is of little, if any, value after the third day Vaccine has the advantage that it can be carried in the bag and injected without delay

In 1 cc ampoules 2/9
and in rubber-capped bottles, 5 cc 8/6 and 25 cc 26/-

CARDATONE EVANS

(Sodium campho-sulphonate solution)

A cardiac tonic for intravenous or intramuscular administration in failure of the circulation during pneumonia

In ampoules of 1 cc, boxes of 6 (2/6) and 12 (4/3)
,, ,, 2 cc, boxes of 6 (3/-) and 12 (5/6)
In rubber-capped bottles of 5 cc. (2/-) and 10 cc (2/9)

Liverpool and London

When the prostatic cavity had been packed owing to haemorrhage during or immediately after the operation the gauze was also removed on the second day For the first four days the bladder was irrigated by means of a catheter passed through the suprapubic opening, from the fourth to the ninth day it was washed out by Janet's hydrostatic method After the ninth day a catheter was passed per urethram daily and bladder lavage performed until natural micturition was resumed or, in septic cases, even longer

Epididymitis occurred in seventeen of the series in sixteen of these it was of a mild transient type, which reacted well to treatment, while in one patient there was abscess formation

Deaths

In this series of 158 cases there were six deaths (mortality rate 3 7 per cent), the causes of which were pneumonia, two cases, fifth day and eleventh day, uraemia, two cases, fifth day and eleventh day, paralytic ileus and cardiac failure, one case, eighth day, pyelonephritis, one case, seventh day

Commentary

The surgical treatment of prostatic enlargement is a subject which has given rise to much controversy, and it would be difficult to find another pathological condition for which the operative technique varies so much The need is for an operation that will cure the largest number of cases with the least risk, and the one which in my opinion does that is the two-stage prostatectomy through a short suprapubic incision The advantages of this method are

1 A short suprapubic incision is sufficient If a long incision is used prolapse of the bladder mucous membrane through the suprapubic fistula or hernia of the suprapubic scar may result, however careful one may be in repairing the abdominal wall after removing the prostate

2 Shock is reduced to a minimum It is in my opinion, less than in any other technique used in prostatectomy

3 There is much less haemorrhage than in the one stage "blind" operation

4 The kidneys are allowed time to resume their normal function before the actual prostatectomy

5 Sepsis is reduced When the urine is infected there is much less tendency to septic complications after prostatectomy by this method This is evidently due to the auto inoculation which results from the preliminary cystotomy

6 It is possible to cut down to a minimum the use of the catheter, which to some patients is an instrument of torture and to all a method of treatment conducive to sepsis

7 With this method there need be no fear of producing vesical neck pockets in which urine stagnates

8 The patient is left with a large vesical outlet which is very important in old men who cannot be expected to have the expulsive power present in young patients

Some of the chief criticisms levelled against the two-stage operation are the two anaesthetics and two operations the longer time in nursing home or hospital, the difficulty of enucleation of the prostate owing to fibrosis produced by the use of the suprapubic tube, and delayed healing of the suprapubic opening

I have yet to meet the patient who objects to two anaesthetics or two operations if he is given to understand that it means less shock and less danger than if the whole procedure were carried out in one stage As regards length of time in hospital when one remembers that the period of preparatory treatment before a preliminary cystotomy need not be so long as that necessary before a one stage prostatectomy, one realizes that the difference of time usually only amounts to a few days, and again my experience convinces me that patients do not in the least object to this little extra time when they learn that it means a greater degree of safety In comparing the time required for this technique with that required in prostatectomy with immediate closure of the bladder one must remember, too, the long period of preliminary catheter drainage usually employed in the latter In connexion with the criticism that enucleation is more difficult than when the operation is done in one stage, this has not been my experience I have never had any difficulty in removing the adenomatous mass at the second operation Finally, with reference to delay in healing I have not found any lengthening of the convalescence period

Some of the surgeons who advocate plastic procedures on the prostatic cavity after removal of the prostate in referring to the one-stage and two stage "blind" operations draw rather ghastly pictures of the patients who in their opinion, have had the misfortune to be subjected to such operative procedures They describe the patients as being exhausted by haemorrhage and sepsis In this series of 158 cases I have not had a single patient whose convalescence was even affected by reactionary or secondary haemorrhage, or who, much less, was exhausted by or died from loss of blood As to sepsis I should have thought it would be much more to the point to attack the post-operative treatment rather than the technique of the operation With their so called reformation of the prostatic urethra the same surgeons claim that sepsis is much reduced if not eliminated, and that post prostatectomy obstruction at the vesical neck rarely, if ever occurs Taking into consideration the long preliminary catheter drainage, the pockets which must necessarily be formed in a very large percentage, if not all of their cases the mode in which the bladder neck is sutured round the indwelling catheter which is left *in situ* for ten or more days after the operation—to say nothing of other possible or rather probable complications—I cannot think of any other technique which is more conducive to sepsis and post-operative obstruction

Summary

1 The results of prostatectomy by the two stage "blind" method are presented in a series of 158 consecutive cases

2 There were six deaths, the mortality rate being 3 7 per cent

3 A short outline of pre- and post-prostatectomy treatment is described

4 It is suggested that many of the complications which follow prostatectomy are avoidable by using this technique

---

P Schmidt (*Med Welt* November 28, 1936, p 1711) maintains that an effective prophylaxis is possible not only of the common cold but also of the true infective influenza The diagnosis of influenza can be established during the first few days of the illness by the presence of the Pfeiffer bacillus of influenza and the haemolytic streptococcus or pneumococcus (on the Levinthal medium) The affected patients particularly those who show a high temperature, should be isolated immediately Spread of infection through cough should be prevented by appropriate measures (coughing in a handkerchief etc) It is particularly important to isolate the first cases of illness which appear in the autumn or early winter The responsibility for carrying out these measures should rest not only on the medical practitioners but also on the lay persons responsible for the welfare of groups of the community

I intend in future to tackle the exostoses through the external auditory meatus provided they are not too near the drum The use of the electric dental burr is in my opinion absolutely safe if the handle is held firmly and a little dexterity is acquired in its manipulation, as, for instance, on a piece of ivory After all, only partial removal of the exostosis is necessary to relieve deafness and as a preliminary to efficient treatment in a concomitant suppurative otitis media, and there is no reason why this should not be done by way of the external meatus

PSYCHOLOGICAL FACTORS IN RHEUMATISM

A PRELIMINARY STUDY

BY

JAMES L HALLIDAY. M D , D P H

Regional Medical Officer Department of Health for Scotland

PART II

The principles governing an understanding of psychological factors in rheumatism may be illustrated not only by taking as examples individual patients but by studying patients in series The accompanying table shows the analysis of twenty-one insured persons (referred by their societies for examination and seen during one year) who in the absence of organic disease and of any ' inferiority," complained of rheumatism " in the neck, shoulders, or arms Before the onset of the rheumatism each of these patients had encountered one or more disturbing psychological factors to which the response had been an emotional reaction which merged into a psychoneurotic anxiety state The complaint of ' rheumatism " developed as one symptom among many during the course of the illness and, when it appeared it rendered the patient sooner or later incapable of work

Serial Investigation of Rheumatism of the Neck, Shoulders, and Arms

The table is divided into five sections, indicating the topographical distribution of the rheumatism —namely, Section A—the neck—four patients , Section B—the neck, left shoulder and arm—six patients , Section C—the neck and various sites—five patients , Section D—left shoulder and arm—five patients , Section E—right shoulder and arm—one patient The findings of the table may be summarized as follows

Age Sex Marital States and Occupation—The total number of patients was small—namely, twenty one (eight males and thirteen females) Both sexes and all age groups were involved The largest number (seven patients) occurred in the age group 25 to 35 As regards marital status, patients belonged respectively to all the groups—namely single married and widowed (or separated)—and this applied to both sexes The largest number occurred in unmarried females (eight patients) The occupations were various that of domestic service providing five patients and that of shop assistant four patients

Type and Appearance of Patient—The notes under this heading are owing to the short time available for each examination necessarily inadequate As regards physical habitus eight patients were spare twelve were well covered, and one was obese The patients manner and bearing were described under the three headings of (1) anxious (showing objective signs of the anxiety state such as restlessness tremors tachycardia and taches , (2) depressed and (3) detached The detached patients were placid cheerful or smiling and their behaviour suggested hysteria rather than an anxiety state Of the spare persons seven were anxious and one detached Of the thirteen who were well covered or obese six were anxious four depressed and three detached Two of the patients notably No 9 and to a less extent No 5 were obviously unstable personalities two—namely Nos 3 and 6—were poor types who had a degree of mental deficiency The remaining patients, however were conscientious superior people with a fair degree of intelligence It may be concluded that no single type of bodily habitus is associated with rheumatism of the neck and arms There is also a suggestion that this manifestation of psychoneurosis tends to occur more frequently in self respecting independent persons

Environmental Encounters—The inventory of environmental encounters which provoked psychoneurotic illness in respect of each patient is far from exhaustive The items noted however represent happenings which were very definite and could be dated There is no easy method of classifying these but the following indicates the relative incidence of those recorded in the table (1) Domestic—(*a*) death seventeen times (namely marital partner four child four parent six brother or sister three) (*b*) illness in family six times , (*c*) misbehaviour in family one (*d*) *separation or jilting four times* (2) *thwarted occupation* eight times (3) Severe financial stress three times The predominance of bereavement is noteworthy Good examples of getting it in the neck —in the sense of multiple deprivations encountered within a short period of time—are seen in Nos 1, 5 7, and 14

Emotional Reaction—The symptoms recorded are only a selection of those which the patients volunteered They include such mental symptoms as grief worry, resentment anger depression and self reproach and such bodily symptoms as tiredness weakness palpitation sleeplessness, cessation of milk choking sensations and soreness all over It is of interest in connexion with the symbolism of the neck to note that personal pride was a prominent finding in Nos 2 15, and 17 and that resentment was very evident in 3, 4, 5, 8, 11, 13, 19, and 21

Chief Rheumatic Symptoms—The chief complaint was pain or stiffness Sometimes there also occurred numbness prickling sensations, and in one or two instances sudden attacks of loss of power (An interesting example of loss of power was No 16 a widower whose illness had developed after the death of his wife He lived alone and when he was making his bed in the morning his left arm which he raised to hold up the sheets fell dead by his side' When this happened the pain in his left arm used to radiate into the back, where it stopped at the last rib "—? Adams rib) Another symptom which sometimes emerged was *swelling of the joints* This was found in patients No 5 (left wrist) No 12 (right knee), and No 19 (fingers) In this connexion it may be noted that not infrequently rheumatoid arthritis may arise in the course of a psychoneurotic anxiety state of six patients with rheumatoid arthritis seen by me during the year of this inquiry three were examples of this

Time Incidence of Rheumatic Symptoms—The time interval which elapsed between the environmental encounter and the onset of rheumatism " in the course of the illness was very variable In four instances it occurred within a week, in seven within three months , in six within six months and in two instances the psychoneurotic symptoms had been chronic for two years before rheumatism emerged Patient No 10 gave a story which indicated that severe pain localized to the back of the neck may emerge during the acute stage of an intense emotional reaction This woman at the age of 33 while carrying her sister's baby through a field was chased by a stallion She had to run and dodge before she was able to drop the baby over the fence I didn't think of myself, I kept saying It'll not get the baby I'll be trampled to death before I let the baby get killed ' Within a few hours she had a reaction accompanied by terrific pains at the back of the neck for which she had to receive morphine These pains lasted about a week and did not recur for nearly twenty years when they came back following the death of her father It is clear that "rheumatism" as an episode in an emotional reaction may be early or late This variation in its time incidence is a feature common to other bodily disturbances of psychoneurotic illness Thus in one patient palpitation may be the first bodily symptom but later it may be replaced by headache or gastric disturbance whereas in another patient headache or gastric disturbance may be prominent in the earlier stages, to be replaced at a later date by palpitation

Diagnosis Treatment and Duration of Incapacity—With regard to diagnosis, eleven patients were labelled rheum

BRITISH MEDICAL JOURNAL

LONDON SATURDAY FEBRUARY 6 1937

CEREBRAL VASCULAR ACCIDENTS*

BY

C M HINDS HOWELL, M D, F R C P

Physician to St Bartholomew's Hospital and the National Hospital Queen Square

I have chosen this subject for discussion because the vascular accidents to which I shall refer are matters of daily occurrence are dramatic in their manifestations and not infrequently give rise to much difficulty in diagnosis Both the physician and the surgeon may be concerned in their treatment and among these cases there will be many which will test our skill and experience to the utmost if they are to be brought to a satisfactory conclusion

We can divide vascular accidents within the skull into *those due to injury and those which result from disease* processes As the result of injury to the head there may follow concussion haemorrhage contusion or laceration of the brain With any of these there may or may not be fracture of the skull

It is a matter of interest that in compensation cases which are all too common nowadays the legal mind appears to attach more importance to the fact of fracture of the skull than to what takes place inside it This is a misleading point of view for we know very well that the skull may be fractured without anything very serious happening within it while the most damaging events may have occurred where no fracture has taken place

It is seldom that haemorrhage occurs in an uncomplicated manner as the result of serious head injury Concussion at least is of common occurrence while contusion or laceration of the brain also frequently occurs These events complicate the clinical picture and make exact diagnosis difficult or impossible I propose to consider first some uncomplicated cases which will illustrate the effects of haemorrhage in two common situations as the result of injury and later the general principles which should guide us in more difficult cases

Extradural Haemorrhage

In an uncomplicated case the patient receives some injury to the head as the result of which he may suffer from a short period of concussion He recovers from this and after an interval of varying but short duration he develops symptoms of cerebral compression There follow headache vomiting slowing of the pulse which is full with a rising blood pressure perhaps paralysis then unconsciousness and if the pressure be not relieved the next stage is death The interval between the original injury and the later development of cerebral compression is the so-called lucid interval All cases of extradural haemorrhage are fortunately not so serious as our hypothetical case for the haemorrhage may cease before it causes serious compression

Some years ago I was consulted by a young man who while batting at cricket had been struck on the left temple by the ball He was knocked over and for a few minutes was dazed (period of mild concussion) He was able to continue playing for the rest of the afternoon though his head ached (lucid interval) After the game his headache became much worse and he vomited (period of slight cerebral compression)

He continued to have headache and three or four days later had a fit which only involved the right side of his face He was not unconscious in the fit but could not speak during the attack He had had several similar attacks and to my great satisfaction had one in my consulting room It was a typical Jacksonian fit affecting the right side of the face only *The man was able to walk about during the attack* obey orders and in fact do everything except talk

In his case the diagnosis of extradural haemorrhage was not difficult to make An operation was performed at the site of injury and an extradural clot found and removed The dura was opened but no bruising or haemorrhage was present beneath it The man made an uneventful recovery but six months later had two generalized epileptic attacks He was put on bromides for about eighteen months but has had no further attacks

This patient should have been put on some sedative—luminal 1 grain every night for example—immediately after his operation It is most important to remember that cases of this kind require this type of medical treatment even after a successful operation such treatment being continued for a period of six months at least

Subdural Haemorrhage

This may be diffuse or localized In the former which is usually associated with severe head injury a venous sinus may be torn when blood will diffuse rapidly through the subdural space and symptoms of compression are likely to develop quickly

The localized form of subdural haemorrhage is by no means uncommon and it is important to recognize the clinical picture to which it gives rise I will briefly describe two cases of this kind one in an elderly subject the second in a young man

In the first case a man of 65 was hurrying to catch a bus when he was knocked down by a boy on a bicycle He hit his head was not unconscious but rather dazed He was kept in bed for two or three days but did not pick up He complained of headache and was irritable This state of things continued for about a month at the end of which he began to lose power in his left leg and later in the left arm He became drowsy and confused When I saw him he had a low grade papilloedema in both eyes and a slight left hemiplegia I got Professor Rose to operate on him for what one subdural haematoma We found a large clot wrapped in the peculiar membrane which forms in such cases The underlying brain was guttered by the pressure of the clot. Next morning he was much brighter but later became comatose and died At the post mortem examination a second similar but larger clot was found over the left cortex

Lessons to be learnt from this case are that in elderly people a comparatively slight injury may cause a localized

15	F single 47 years secretary	Independent conscientious very intelligent well covered anxious	For 8 years had been in charge of accountancy side of the business In December, 1934 discovered that her employer was interfering with the books In January 1935 was off duty for three months with nervous breakdown Returned to work in April but she kept looking for other employment but with no success	'Shock at employer's conduct Was torn between her independence' and the impossibility of obtaining another job at my age Sleepless sweatings sore all over	Pain at back of neck between upper scapulae and in knees, May, 1935	(1) Fibrositis (2) 5 weeks (3) Yes

the diagnosis Of course examination of the blood urea would do so too

Occasionally glycosuria may result from subarachnoid haemorrhage I remember such a case well at St Bartholomew's Hospital We were on duty and my house physician told me that he had admitted a patient in diabetic coma The patient was brought into hospital unconscious and the house-physician had found sugar and acetone in the urine in large quantity He had given intravenous glucose saline and 50 units of insulin but he reported that the patient was still semi conscious and apparently had some rigidity of the neck I told him that if he would do lumbar puncture he would almost certainly find a uniformly blood stained fluid and such proved to be the case

Rigidity of the neck, which is a very common feature of these cases, is due to irritation of the posterior roots in the cervical region by the extravasated blood and often patients complain later of pains in the legs due to a similar cause A cerebral aneurysm may produce palsies of some of the cranial nerves before rupture those most likely to be affected being the sixth and third nerves

A woman was admitted under my care at St Bartholomew's Hospital with a subarachnoid haemorrhage She made excellent progress and was due for discharge when she developed a third nerve paralysis in the right eye, and the next day had a second subarachnoid haemorrhage She ultimately recovered from this and for the last few years has been working as a cook housekeeper, but the third nerve palsy persists

Some patients have had as many as four or five haemorrhages recurring at intervals and have survived, but the condition is a very dangerous one, and the first attack may be fatal

The youngest patient I have seen with subarachnoid haemorrhage was aged 9, he made a good recovery and is leading an ordinary life Although a cerebral aneurysm may rupture at any age it is commonest between the ages of 20 and 40 Another point in connexion with aneurysm of the cerebral vessels is that some of them attain a large size and give rise to symptoms suggestive of tumour You will find it stated, I think with decreasing frequency that a bruit can be heard on auscultation where a cerebral aneurysm is present I believe this statement to be quite untrue except in the case of arterio venous aneurysms, in which the patient is himself conscious of the bruit

Accidents Due to Cardiovascular Disease

The common examples of vascular accidents in the brain which result from disease of the cardiovascular system are thrombosis haemorrhage or embolism of the cerebral vessels But there is another group of cases of great interest, though by no means so common as those just mentioned which I should like to deal with first The condition has been called by McAlpine the hypertensive attack These occur in patients suffering from high blood pressure with or without obvious renal disease I do not include among them cases of frank uraemia in which the non protein nitrogen in the blood is definitely raised though it is probable that the cerebral manifestations that occur in uraemia—such as convulsions temporary paralysis amaurosis, and coma—are due in the main to a rise of intracranial pressure associated with oedema and angiospasm, such as occurs in the cases to which I am referring

Patients with high blood pressures in this group are liable to exacerbation of this pressure with which obvious cerebral symptoms may be associated In these attacks the patient complains of severe headache, and there may be in addition vomiting drowsiness, or even coma and sometimes convulsions Transient paralysis may also occur In some of these cases examination will show papilloedema suggesting the presence of a cerebral tumour unless the picture presented by the fundus is considered very carefully and the associated blood pressure also taken into account The appearance of the disk is not really like that seen with cerebral tumour for haemorrhages form a striking part of the picture in addition to the swollen disk, and the vessels of the retina show marked nipping of the veins at the crossings and the calibre of the arteries is seen to vary very much in different parts of the same vessel due to angiospasm

McAlpine has pointed out that young patients are more likely to suffer from cerebral oedema with papilloedema than older ones and has demonstrated that the attack is associated with a very definite increase in blood pressure the subsidence of which is followed by relief of symptoms

Let us now consider some questions which always arise in connexion with embolism thrombosis, or haemorrhage of cerebral vessels

Cerebral Embolism

First as to diagnosis This is sometimes obvious but often a matter of great uncertainty As a rule embolus can be diagnosed with more certainty than the others The embolus may come from a diseased valve usually in this case the site of bacterial endocarditis In cases of mitral disease it is more likely to be a clot detached from a dilated left auricle But the presence of obvious valvular disease and the very sudden onset of symptoms usually leave no doubt as to the diagnosis It is naturally likely to occur at an earlier age than either thrombosis or haemorrhage We must not however overlook the possibility of embolism occurring from the surface of an atheromatous plaque in the aorta of older subjects Apart from valvular disease it may arise as a sequel to dilatation of the heart whatever the cause of such dilatation may be for clots may form under such circumstances in what we might describe as the backwaters of the heart This occurs sometimes in the puerperal state so that embolism has a rather higher incidence in women than in men for this reason and because of the higher incidence of mitral stenosis in women

Following embolism of a cerebral artery there may be consecutive thrombosis so that the symptoms at the onset become permanently established On the other hand if the clot be a small one it may retract and allow the blocked vessel to become patent again when great improvement in the condition will follow or if no secondary thrombosis results the symptoms are likely to improve as the oedema caused by the infarction subsides

Cerebral Thrombosis and Haemorrhage

Thrombosis and haemorrhage both result from disease of the cerebral arteries It may be easy to distinguish between them clinically but as you all know it is often impossible to do so There is a school of thought to which I cannot subscribe which maintains that all cases of cerebral haemorrhage are fatal This is a comfortable doctrine, because if you believe it the treatment for all cases becomes the treatment for cerebral thrombosis Let us consider to what extent it is possible to differentiate these cases with any degree of certainty

In a young adult hemiplegia of sudden onset is more often due to syphilitic thrombosis than to anything else provided you can exclude embolus tumour of the brain and disseminated sclerosis I am assuming that hysteria is not in question Subarachnoid haemorrhage and embolus we have already considered Tumour of the

example of this Some practitioners find it very frequently, whereas others in the same locality only discover its presence on relatively rare occasions

Knowledge of how not to injure the person—and harm can be done by word as well as by deed—requires an understanding of the three main characteristics of psychoneurotic illness These were described in a previous paper (Halliday, 1935), from which the following is a quotation

"Disturbances of the emotional self are only imperfectly appreciated and understood by the conscious self Because of this the person with psychoneurosis shows three interesting characteristics

"1 *Innocence and Rationalization*—The patient is not properly aware of the relationship of his bodily disturbances to his life's difficulties The processes at work proceed apart from the consciousness of the patient, who is unaware of what is happening and is unable to understand why he has become different His conscious attention is distracted from his life's difficulties and becomes dominated by his symptoms, which he interprets as evidence that he is physically ill Moreover, he rationalizes—that is to say, his intellect provides him with an explanation of his illness usually in terms of his physical environment, and he blames such factors as heat, cold, damp, bad air, unsuitable food, strain, injury, or overwork As a corollary the patient expects to find his salvation in physical therapeutics—for example, tonics, drugs, injections, massage, fancy diets, change of air, extraction of teeth, operation, ultraviolet rays etc This characteristic of rationalization provides two pitfalls for the practitioner First, the patient's own account of the aetiology of his illness may be entirely misleading, and, secondly, when a patient clamours for injections, ultra violet ray, massage, or operation, then we have to remember how much psychoneurotics love these things

'2 *Increased Suggestibility*—When the emotions come into play the conscious intellectual mind loses its power of judgement It accepts, without discrimination, ideas and statements As doctors we all know that when illness attacks a member of our family and we become anxious, not only our medical judgement is affected, but even our powers of accurate observation In short anxiety makes us suggestible Patients with psychoneurotic illness respond excessively to suggestion, especially unhealthy suggestion Any remark or hint by the doctor about organic disease is eagerly accepted by the patient whose subconscious mind elaborates the term to suit its purpose Any hesitancy by the doctor, any talk about conditions" or slight weakness," is interpreted as evidence of serious disease, and the symptoms of the patient increase A written certificate issued weekly giving the name of a disease has a definite Coué effect towards morbidity Week by week, the certificates speak Bronchitis, bronchitis, bronchitis —with the result that in time the conviction of organic disease and with it the symptoms, become fixed

"3 *Motive and Purpose*—Emotion has for its purpose the preservation and perpetuation of the self, this response, however, is a blind one below the intellectual level, and the patient is not conscious that his illness' may be regarded as a purposeful reaction It usually provides a way of escape from an intolerable situation—personal financial, or occupational The patient becomes the object of solicitude and attention He secures sympathy instead of derision The illness may act as an explanation, as when a man fails in an examination, or in his business or loses his employment, or fails to play games as he used to When the 'pension situation' exists—that is, when a person is paid money because and so long as he is ill, the illness provides a material advantage We have to recognize that 'many patients are not prepared to take the consequences of becoming well'' (Ross, 1929).

Certain further observations in relation to psychoneurotic rheumatism can be made under these headings

Innocence and Rationalization

Many patients who have worked for years without physical symptoms in atmospheres of heat, cold, or damp will attribute their rheumatism to one or more of these factors That these may have a cumulative effect leading to a breaking-point in the patient's resistance cannot be doubted, but not infrequently on investigating psychological factors we find that the illness is really one of emotional reaction in which pain and stiffness emerge as symptoms—not because of the direct action of these physical forces on the body tissues—but because knowledge of these forces as 'causes of rheumatism" has served to increase the fears of the patient and helped to focus his attention on the aches and pains which have arisen, naturally, in the course of an anxiety state

Concerning the desire of the psychoneurotic patient for physical therapy, mention may be made of massage This is presumably a physical method of treatment designed to effect physical changes such as the wearing down of fibrous tissue or as a method of passive exercise Among insured persons I have noted that many with structural changes who would benefit by massage do not receive it because, not being psychoneurotic, they do not clamour for it on the other hand, many persons with psychoneurotic illness are receiving massage because they clamour for it Massage administered in this unconsidered way only serves to fix the symptoms and prolong the incapacity Where massage fails such patients usually run the gamut of all the electrical appliances available in the out-patient department In such instances Roheim's (1930) description of the medicine-men of Borneo seems not inapposite

"To see a party of these doctors feigning to draw by hand an evil spirit or a malady from a person's body is very amusing At times one can find a circle of them dancing round and round and feigning to catch evil spirits The demon may lodge in a joint and then it is hard indeed to get him out!"

A word may be said about indoor hospital treatment When persons ill with psychoneurosis are admitted to hospital they often improve and remain improved for some time after dismissal, then they relapse In this connexion it should be remembered that hospital or residence at a spa—quite apart from any physical treatment received—represents a removal of the patient from the psychological factors of his everyday environment, both domestic (for example sick children, a feckless wife, the *rent book on the mantelpiece*) and occupational (such as a nagging foreman, fear of injury or disease, and uncongenial work) For such patients a hospital bed or residence at a spa may be like the Garden of Proserpine described by Swinburne

> "Here, where the world is quiet,
> Here where all trouble seems
> Dead winds and spent waves'

The Factor of Increased Suggestibility

"An important principle is not to make illness by incautious expressions There are certain words which the physician should keep under lock and key as he would strong poisons The terms 'spinal cord' (and 'spine') pierce nervous people to the marrow to such an extent that they may even produce a hysterical disturbance of gait there and then" (Kretschmer 1934) The word "rheumatism," although generally accepted by the laity as meaning pain and stiffness, may also be "poison" in the case of persons who have known or seen a relative or friend crippled with rheumatoid arthritis Patients do not voluntarily tell the doctor about the diseases they fear Sometimes this is because the fears are repressed, sometimes the patient is quite aware of his fears and is afraid to tell his doctor in case they are confirmed

However, patients will confess when they are asked in the proper way It is therefore important after making an examination in which physical signs are negative to ask the patient his views regarding the nature of his illness as well as the "diseases" he has met among his acquaintances If we omit to make such inquiries, and simply tell the patient that he is sound or almost sound his fears of disease as well as his symptoms increase because he thinks that we are merely being kind to him and that by keeping silent we are sparing his feelings

Mrs Eddy the foundress of Christian Science used to inform her pupils that the first duty of the practitioner was to begin by allaying the fears of the patient Medical

TYPES OF C DIPHTHERIAE IN CAPETOWN

BY

JOYCE WRIGHT, B M , B Ch

Department of Bacteriology, University of Capetown

Reports from different areas in England and Scotland, and also from Berlin have shown that the distribution of *C diphtheriae* types varies considerably from one locality to another It therefore seemed of interest to investigate their incidence in another country at a considerable distance from Europe Strains from all diphtheria patients admitted to the Capetown City Hospital for Infectious Diseases were accordingly received from the Government Laboratory over a period of approximately seven months and investigated as to cultural characteristics biochemical reactions, and virulence

Methods

Cultures reported as positive for *C diphtheriae* were subcultured on to Loeffler slopes incubated for eighteen hours and then plated on to McLeod's tellurite rabbit blood agar, the colonial appearance being examined after twenty four and forty eight hours Pure cultures were then obtained by subculture to Loeffler slopes, which after eighteen hours incubation were tested for virulence by the intracutaneous guinea pig method for fermentation of glucose and of saccharose for fermentation of starch (Bacto) and of glycogen (B.D H) in Hiss's serum water, and for their type of growth in nutrient beef heart infusion broth after twenty-four and forty-eight hours incubation.

Bacteriological Observations

Altogether 109 strains were isolated all fermented glucose but not saccharose and with one exception were virulent by intracutaneous guinea pig test They were classified according to the scheme introduced by H A Wright and M H Christison (1935) (Table I) An additional type (Type VII) was included This will be discussed later

TABLE I—*The Incidence of Biological Types of C diphtheriae in Capetown*

Type	Colony Form on McLeod's Medium	Fermentation of Starch	Virulence	Percentage Incidence
I	Mitis type	−	+	53.2
II	Intermediate type	−	+	0
III	Gravis type	+	+	6.4
IV	"	−	+	22.0
V	"	+	−	0.9
VI	"	−	−	0
VII	Mitis type	+	+	12.9
Unclassified				4.6

Type I—Of these 109 strains fifty eight (53.2 per cent.) were classified in this group Of these forty nine had typical black shining mitis colonies Nine other strains differed from the typical mitis form only in that their colonies were slightly matt or very faintly striated They were therefore not sufficiently different to classify as any other type In broth all these strains produced clouds growth without pellicle formation In some instances unrelated to the type of colony the growth was slightly flocculer but was very easily broken up on gentle agitation

Type II—No strain fell into this group—the intermediate group of Anderson and his co workers.

Type III—Seven (6.4 per cent.) strains only were classifiable as Type III They differed slightly in colonial appearance from the "gravis" strains described by Anderson and his co-workers in that the colonies were slightly smoother slightly darker and slightly smaller but they were not sufficiently different to classify as any other type In broth they all produced a pellicle deposit and fine granular type of growth

Type IV—Twenty four (22 per cent) strains fell into this group They could be further subdivided by their colonial appearance thus seventeen produced the same type of colony as those of Type III above three produced the typical daisy head gravis colony and four gave a mixture of these two types of colony In broth all these strains produced a pellicle deposit and a fine granular type of growth

Type V—One strain (0.9 per cent) belonged to this group It also had the slightly smoother type of gravis colony which predominated in Types III and IV In broth it produced granular growth pellicle and deposit

Type VI—No strain fell into this group

Type VII—This type has been added since fourteen strains (12.9 per cent) differed from Type I only in that definite fermentation of starch and glycogen occurred during twenty four hours incubation Eight of these strains showed typical mitis colonies and six only differed by having a slightly matt surface

Unclassified—Five (4.6 per cent) strains were not classified owing to their type of growth in broth Three were of the mitis type of colony but one was granular in broth and fermented starch and glycogen another produced a very slight pellicle and did not ferment starch or glycogen and the third gave a granular growth deposit and pellicle and fermented starch and glycogen

Two strains produced granular growth and pellicle formation in broth fermented starch and glycogen but in colony form were not clearly differentiable as gravis or as mitis

Clinical Observations

Clinical notes were obtained independently from the Capetown City Hospital and in a few instances from private practitioners The cases were grouped as severe moderately severe and mild according to the classification of Bie (1929) Owing to the mildness of diphtheria in Capetown the additional group of very mild was added to include those cases in which slight sore throat or nasal discharge and pyrexia accompanied by a positive swab were found In the severe group were included all those cases in which laryngeal involvement occurred or in which evidence of toxicity was present such as albuminuria and palatal paralysis

During the period in which the strains were collected there was no epidemic of diphtheria in the locality In the majority of the cases the disease was mild and there was little toxicity As has been previously observed in Capetown the number of patients with laryngeal involvement was high in this series being 7.3 per cent The dosage of antitoxin was on the whole less in the mild cases than in the severe being on an average 20 000 units in the moderately severe and severe cases Usually it was given later in the disease in the mild (three and a half to four days) than in the severe (two and a half to three days) cases

Clinical data were procured in ninety six cases those in which the cultures proved avirulent or the atypical being omitted from the series Of these ninety six cases sixty seven (70 per cent) were due to Types I and VII and twenty nine (30 per cent) to Types III and IV the distribution in relation to clinical severity being shown in Table II

Of the fourteen severe cases three were fatal—that is in this series there was a mortality of 3.1 per cent Of the three fatal cases one was laryngeal tracheotomy being

Eleven cases of primary sterility have been treated in this way In each the obstruction was bilateral and near to the fimbriae, and the ligatures were placed on the ampullary part of the tubes Two patients subsequently became pregnant, and were delivered of living children at term One, who conceived six months after operation, has had two abortions since the birth of her baby The other did not conceive for nearly three years, and has only recently been confined I have carried out Rubin's test on six of the remaining nine cases In only one were the tubes found to be patent

COMMENTARY

The simplicity of this method would seem to warrant its more extended trial, but I must emphasize that my experience has been limited to ligation of the ampullary portion of the tube In the light of recent findings (Haselhorst, v Mikulicz-Radecki, 1936) on the behaviour of the tube during ovulation the poor results of operations on its uterine end are more readily understood Finally I confess to some hesitation in recommending a technique which seems at first glance to be at variance with ordinary surgical principles, and, although a small series of cases has not been entirely barren of results, the method should not, I think, be regarded as established unless it is confirmed by adequate experiments on suitable animals

Bilateral Abductor Paralysis Necessitating Tracheotomy in Labour

A patient with bilateral abductor paralysis of the larynx has only a small margin of safety, and any unusual strain, whether by exertion or the incidence of an upper respiratory infection may bring danger of fatal asphyxia In the case described below the patient was able to carry on until full-term pregnancy and the onset of labour precipitated acute obstruction

Mrs X, aged 32 had a thyroidectomy performed in a London hospital in 1933 almost immediately after the operation she had weakness of the voice and dyspnoea on exertion This continued, but she was able to carry out her normal housekeeping activities, though never with complete comfort Some months after her operation she became pregnant but aborted at six months, the laryngeal condition providing no difficulty

She was admitted to the Kent and Canterbury Hospital in September, 1936, in a state of severe collapse and asphyxia She was nine months pregnant, slight labour pains had begun the previous night, a sedative injection had been given, and the patient was discovered that morning in a state of collapse

An immediate tracheotomy was performed, the patient's condition at once improved, labour pains recommenced a few hours later and a healthy child was born twelve hours after the tracheotomy Convalescence was entirely normal

The patient is retaining her tracheostoma and leading a normal life I have advised against any plastic operation on the larynx owing to the uncertain result upon the airway and the possible damage to the voice

THOMAS A CLARKE,
Surgeon in Charge Ear Nose, and Throat Department Kent and Canterbury Hospital

Reviews

PAGET'S DISEASE OF THE NIPPLE

Paget's Disease of the Nipple and its Relation to Surface Cancers and Pre cancerous States in General By Keith Inglis, M D, Ch M (Pp 233, 237 figures 36s net) London H Milford, Oxford University Press 1936

The histogenesis of Paget's disease of the nipple is still in considerable dispute and Professor Keith Inglis, in an extensive monograph on this and kindred subjects, has put forward a further explanation for the condition He regards it as a peculiar form of surface cancer, almost limited to the breast, the only extramammary example which he accepts being the case of Paget's disease of the vulva described by Drake and Whitfield In his view the carcinoma begins in a lactiferous duct at its junction with the epidermis or just below this The growth forms no definite nodule but extends by continuity, downwards in the epithelium lining the duct to the acini and outwards in the epidermis of the nipple Both the duct and the skin lesions represent the same "primary" stage in the pathological process, but in a later stage a scirrhus carcinoma may form in the substance of the breast as an infiltration into the connective tissue from the ducts or acini, a spread is never seen from the carcinoma in the epidermis into the dermis

To explain those cases in which Paget's disease of the skin of the nipple has appeared after a scirrhus cancer has formed in the substance of the breast, he suggests that the scirrhus carcinoma is a sequel to Paget's disease of the ducts and that the duct lesion has extended later to the skin of the nipple, not as a secondary complication but as a delayed direct extension of the primary duct lesion To uphold this thesis the author describes nineteen cases of Paget's disease of the nipple, some of which were associated with a scirrhus carcinoma, and contrasts these with other forms of cancerous infiltration and eczema of the nipple, unfortunately he does not mention the incidence of Paget's disease of the nipple in his series of cases of breast cancer, nor how often he found an intraduct carcinoma without Paget change in the nipple

The essential difference between the author's view and that of Sir Robert Muir is that Professor Inglis regards the Paget's disease of the ducts as a special form of intraduct carcinoma in which the carcinoma cells spread between the normal epithelial cells of the ducts without papilliferous proliferations, and holds that the skin lesion is of the same order, whereas Sir Robert Muir does not recognize this special form, but considers all intraduct carcinomata as representing the extreme stage of Cheatle's "dysgenetic hyperplasia" and that any intraduct carcinoma may give rise either to an infiltrating carcinoma or Paget's disease of the nipple as a secondary phenomenon We do not feel that the evidence brought forward by Professor Inglis is wholly convincing, particularly in view of the many cases in which the areolar area, both of epidermis and of lactiferous ducts, is free from malignant change and yet both Paget's disease of the skin and an intraduct carcinoma are present, a normal area of epithelium intervening The therapeutic and prognostic aspects of Paget's disease are not discussed

In the second part of the book there is an account of pre-cancerous conditions and surface cancers in general The author is opposed to the view of Bowen that the pre cancerous dermatoses are related to Paget's disease Though it is true that in a typical case of Bowen's disease the appearances are quite distinct from those seen in Paget's disease, yet there are borderline conditions in

PROSTATECTOMY BY THE TWO-STAGE METHOD

A SURVEY OF 158 CASES

BY

W. K. IRWIN, M.D. Aberd., F.R.C.S.Ed.

Surgeon to St. Paul's Hospital

Fashions change in the field of prostatic surgery with almost if not quite, the same bewildering frequency as in that of dress, and the object of this paper is to outline briefly the surgical treatment and results obtained in 158 consecutive cases treated by the two stage blind operation during the past ten years. After trying at various times many different techniques I have always gone back to the simplest form of enucleation through a short incision without inspection of the cavity after removal of the adenomatous mass.

During my early years in urological practice I performed the two stage operation in about 10 per cent. of my cases, using the Thomson Walker open operation or the one stage blind method in about 90 per cent. But finding my results more satisfactory in the two stage operation, which I originally only used in the so called 'bad risk' patients I gradually did more and more by this method until at the present time I employ it in the majority of my prostatectomy cases. In fact, I now very often work on the principle that what is good for bad risk cases is also good for good risk patients. The more I see of prostatic surgery the more I am convinced that many of the complications which follow prostatectomy some of which may be fatal are avoidable by using the two stage operation. These 158 cases have not been selected for operation with a view to statistical records. On the contrary the series includes all the most unpromising on which I have operated.

Preliminary Treatment

As soon as possible after admission every patient was subjected to the urea concentration test and the quantitative estimation of the amount of urea in the blood. These two tests were applied in conjunction, and on the whole gave a trustworthy guide to the amount of reserve renal function but the results were always interpreted strictly in the light of general clinical findings. In the case of patients who did not have much residual urine the preliminary cystotomy was done two days after their admission into hospital or nursing home provided there was no contraindication. When there was obstruction enough to cause a large quantity of residual urine the bladder was gradually emptied and afterwards drained by an indwelling catheter for two or more days before the first operation.

Once the preliminary cystotomy had been done there was no urgency about the prostatectomy and the length of the interval between the two was determined by the patient's condition after the first operation the general clinical findings the state of the suprapubic wound and the results of the tests of renal efficiency. The interval between the two operations was seven days in 110 (69 per cent.) of the series fourteen days in thirty two (20 per cent.) while in the remaining cases with a few exceptions the interval varied from eight to twenty one days. Between the two operative stages a Hamilton Irving apparatus was fixed to drain away the urine except in a few long-interval cases in which a large de Pezzer tube was used. The bladder was irrigated with boric or very weak silver nitrate solution two or three times a day.

Anaesthesia

On account of earlier unfavourable experiences possibly due to errors in dosage or technique, we have as a rule used general anaesthesia in preference to spinal the latter method although advocated by some authorities has only been used where more or less active lung complications were present in a few cases amounting to about 3 per cent. of the operations performed. Also in view of the general condition of the patients and of other factors a heavy premedication or basal narcosis has not been considered advisable the routine preparation having been 1/6 or 1/4 grain of morphine with 1/100 grain of atropine. A few patients who were exceptionally apprehensive were given intravenous evipan or pernocton as a preliminary, but these amount only to about 1½ per cent. of the operations.

Originally nearly all the cases were given nitrous oxide oxygen, and ether, though only small amounts of the latter were found necessary. Later it was often found possible to dispense with ether altogether and since May, 1934 gas oxygen alone has been used in a little more than two thirds of both the first stage and second stage operations. During the past year ethylene, which has the advantages of giving slightly better relaxation and more complete oxygenation, has been substituted for nitrous oxide in the majority of cases with satisfactory results.

Dr. Clausen who gave the anaesthetics has employed Webber's modification of Boyle's apparatus and the simplest technique has been adopted throughout tracheal insufflation or intubation never having been used.

Technique

In doing the operations my aim was speed and simplicity of technique. Therefore the preliminary cystotomy or actual prostatectomy usually took only a few minutes.

The bladder was exposed through a longitudinal incision of about two and a half inches from the symphysis pubis upwards and a rubber tube an inch in diameter introduced into the vesical cavity. This tube was removed after four days and a slightly smaller one used until the subsequent enucleation of the prostatic enlargement. At the second stage the prostate was pushed forward by a finger of the left hand, on which two gloves were worn while it was enucleated with the index or middle finger of the gloved right hand. The possibility of a partition being left between the vesical and prostatic cavities was always borne in mind and if present was thoroughly divided. For a number of years I have used a clamp incisor which I designed for dividing such a shelf. With this instrument the separating wall is not only divided but thoroughly crushed on each side of the incision.

I have never found it necessary to extend the preliminary drainage opening at the actual prostatectomy. After the prostate was removed a rubber tube an inch in diameter was again introduced into the bladder. There was usually very little haemorrhage during or after the prostatectomy when this technique was used in fact the small amount of blood lost never failed to surprise visiting surgeons. But when there was the slightest anxiety in regard to bleeding I never hesitated to pack the prostatic cavity with gauze.

Post-operative Treatment

When the patient was returned to his room or ward the foot of the bed was raised but in the absence of haemorrhage it was lowered to the horizontal after about four hours and a Hamilton Irving apparatus again fixed. The suprapubic tube was taken out on the second day.

patients A study of the neuroses should come into the ordinary ward work, should be encountered everywhere by the student and woven into the ordinary teaching of clinical medicine and surgery The pressure for teaching on the neuroses is coming from below, the students are eager for it clamouring for it, and if they don't get it from one man or in one school they will go elsewhere No school can maintain its prestige for long if it persists in neglecting its opportunities in this direction '

ROLE OF THE TISSUES IN IMMUNITY

Tissue Immunity By Reuben L Kahn M S D Sc (Pp 708, illustrated 34s) London Baillière, Tindall and Cox 1936

Attempts to use antibacterial sera therapeutically have been on the whole disappointing This has led to the conviction that the tissues play a predominant part in the resistance to bacterial infection Professor Kahn has made a series of studies on the role of the tissues in immunity and now publishes these in book form Working on the lines that have led to great advances in the understanding of serological reactions, he has used relatively simple antigens and has attempted to make his studies quantitative He shows that antigens are fixed in the tissues of actively immunized animals and gradually destroyed, with this fixation of antigen inflammatory reactions appear This sensitization is evidence of immunity and when animals are desensitized by a large dose of antigen their tissue immunity is temporarily abolished The tissues of actively immunized animals differ in their power of thus localizing antigens that of the skin being the greatest Kahn considers that this progress is of primary importance in protecting animals against bacterial infections The skin of very young rabbits cannot fix antigens in this way—the localizing mechanism develops with the full development of the protective function

Evidence of sensitization of the skin appears in actively immunized animals before antibodies can be demonstrated in the serum and tissue sensitiveness can be produced by substances such as racemized proteins, which will not give rise to antibodies in the serum Also when rabbits are passively immunized with rabbit antisera the power of the different tissues to localize the corresponding antigen does not differ as in actively immunized rabbits It therefore appears that the immunization of the tissues takes place independently of the appearance of antibodies in the serum and in the actively immunized rabbit, is not due solely to the adsorption of antibodies from the serum by the tissue cells These investigations do little to elucidate the peculiar allergic conditions occurring in man, which give rise, for example to hay fever and urticaria Professor Kahn suggests that this allergic state is brought about by hyperactivity of the immunological function due possibly to over-stimulation This interpretation represents the abnormality as a quantitative difference in the reaction from that of normals not as a result of abnormal immunization with some antigen The difference between normal and allergic persons may be compared to the difference between rabbits and guinea-pigs These studies minimize the importance of serum antibodies in the resistance to bacteria That does not mean that inquiries into the mechanism of serum reactions and of the various bacterial antigens involved in such reactions are wasted The serum affords a relatively simple medium in which immunity reactions can be observed the results of such investigation will furnish the basis for study of the reactions in the cells

Professor Kahn has included in his text details of the experiments on which his conclusions are based This makes the book difficult to read

ANATOMY OF THE FASCIAE

Fasciae of the Human Body and Their Relations to the Organs They Develop By Edward Singer, M D (Pp 105 24 plates 13s 6d) Baltimore The Williams and Wilkins Co, London Baillière Tindall and Cox 1936

Dr Singer's treatise on the anatomy of the fasciae is based on special dissections, which have been skilfully drawn by Elizabeth B Cuzzort As stated in the preface, the drawings have been made in conformity with the idea expressed by the great Russian anatomist and surgeon Nicolai Ivanovitch Pirogoff—namely that ' illustrations should be for the physician what road maps are for the traveller '

Unfortunately the general excellence and accuracy of the work is marred by a number of mistakes of which it is necessary to mention two or three in order that they may be corrected in subsequent editions The legend to Fig 10 states that the section passes through the fossa glenoidalis scapulae,' whereas the drawing shows that the section has been made above the level of the glenoid fossa and through the acromio clavicular joint Fig 8 shows a section through what appears to be the superior cornu of the thyroid cartilage, it lies close to the greater cornu of the hyoid bone and submaxillary gland which appear in the same horizontal section This has been incorrectly labelled "cornu inf cart thyreoideae In the same plate a section of the common facial vein which lies in front of and outside the carotid sheath is named "v jugularis interna,' and the true internal jugular vein behind it and lying within the sheath is described as a "branch" of the internal jugular vein The dissections have on the whole been well planned but the inclusion of a few special dissections with detailed descriptions of the exact relations of the fasciae and reference to definite operative procedures or diseased conditions such as retropharyngeal or psoas abscess would have been welcomed by the surgeon and have added to the value of the book Although the use of the full Latin or Greek names as headings for paragraphs and for the definition of particular parts has advantages and is generally approved the book in our opinion would have been more readable if the ordinary English equivalents had been employed in the text Moreover, apart from the transatlantic style of spelling such words as "romboid ' "hemorrhages "pterigoideus,' "stylopharingeus ' "ischiorectalis which might shock the older classical scholars on this side of the water, there are numerous uncorrected errors in spelling such as "Scrapis fascia and ' sternodeiodo mastoideus,' which might have been avoided by careful revision The book however, has been conceived on somewhat novel lines, and we hope it will serve the purpose of drawing attention to the importance in general practice of a knowledge of the fascial compartments and septa of the human body

Notes on Books

Dr MALCOLM BURR has written *British Grasshoppers and Their Allies* (P Allan and Co 6s) with the object of stimulating interest in this somewhat neglected group of insects Although between five and six hundred species of Orthoptera are known in Europe, only thirty one occur in the British list north of a line from the mouth of the Severn to the Wash this number is reduced to eighteen Dr Burr remarks that there is great scope for field observation on the habits of these insects while many problems of geographical distribution and oecology await solution The book is written within a framework of scientific classification and a special feature is provided in the distributional maps showing at a glance in which counties various species have been observed

EXOSTOSES OF THE EXTERNAL AUDITORY MEATUS

A TECHNIQUE FOR THEIR SURGICAL REMOVAL

BY

ARTHUR MILLER, F R C S Ed., D L O

Laryngologist the French Hospital Consulting Oto laryngologist Ealing and Wimbledon Fever Hospitals Assistant Aurist L C C

Exostoses* of the auditory meatus are due either to partial hyperplasia during the stages of development and ossification or to chronic suppuration of the middle ear which causes a periostitis with subsequent new bone formation Some rare cases are caused by syphilis trauma or the irritation of prolonged and frequent immersion in salt water Exostoses are often bilateral and multiple usually sessile and of slow growth they never become malignant, and are said to occur more often in men than in women They are found anywhere in the bony meatus, and appear as rounded elevated masses with tense and somewhat blanched skin covering them They are usually of ivory hardness and consistency

An exostosis may actually press on the membrana tympani and then give rise to tinnitus and reflex cough, or it may gradually increase in size until it comes in contact with another exostosis or with the opposite wall, causing pain as a result of pressure It might completely occlude the meatus The lumen is then reduced to a minute slit like opening which may fill up with cerumen and debris or with exudation of an intermittent dermatitis, or it may fill up with muco pus in a concomitant otitis media or with the secretion of the sweat glands on a hot day or with salt water in bathing In either case complete intermittent deafness with autophony and tinnitus will result

It is generally accepted that exostoses should not be interfered with unless they cause untoward symptoms The following are the indications for their surgical removal (1) deafness and tinnitus (2) incarceration of wax which cannot be removed by syringing, (3) obstruction to the outflow of pus from concurrent middle ear disease in order to establish free drainage and an opportunity for treatment of the middle-ear cavity (4) dermatitis with secretion and (5) pressure symptoms with neuralgic pain

It is said by many otologists that the surgical removal of exostoses of the meatus is an operation which might present great difficulties and is not devoid of danger to the patient because the very great hardness causes the chisel to drive on when the last fragment of them is divided, and it would be easy to damage the facial nerve or even the cochlea Some of them are so hard that they turn the edge of all our instruments they tend to split off and carry with them quite sizable pieces of bone (Watkyn Thomas and Yates 1932) To avoid these complications I practise a different technique to deal with this contingency While no claim is made for originality I was unable on perusing the vast literature on the subject to find any mention of this technique anywhere

The Operation

The chisel and mallet are discarded altogether and instead a burr propelled by an electric dental drill is used Owing to the rapidity of motion of this machine very little pressure is necessary and the burr is therefore not likely to slip and cause any injury to the surrounding structures As the bony prominence is reduced very gradually there is no danger of splitting or fissuring the bone Another advantage is that very little bleeding takes place as the heat produces a quick coagulation of the blood

Illustrative Case

A man aged 52 had bilateral multiple exostoses which produced complete intermittent air conduction deafness on the left side One large exostosis which was attached to the anterior wall was in contact with the postero superior aspect of the meatus there were also several smaller ones on the posterior wall and on the floor Under general anaesthesia

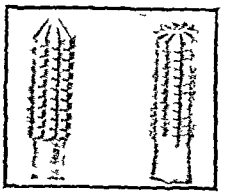

Fig 1 Fig 2

an incision was made similar to the one used for the cortical mastoid operation and the auricle was pulled forward An attempt was made to lift the membrano cartilaginous meatus out of the bony canal but this was not entirely successful I therefore opened the external meatus and removed the bone around the postero superior aspect of the osseous meatus with nibbling forceps This brought the exostosis into full view The skin over the bony prominence was then incised with a fine bladed knife and elevated During this process it was torn and fringed A cross-cut enamel burr with a pointed fissure (Fig 1) was then applied with a firm hand to the anterior exostosis This required no skill but patience since the bone was very hard and yielded to the pointed burr only slowly though steadily

As soon as a path had been made the pointed cross-cut burr was exchanged for one with a flat fissure using the cross cut surface (Fig 2) With a to and fro movement applying gentle but continuous pressure this burr did the work very quickly shaving off the exostosis with great ease There was very little bleeding. As soon as feasible a half inch plugging was pushed past the exostosis to protect the drum The process of reducing the bony prominence with the dental burr was continued until the whole tympanic membrane was clearly visible the latter appeared to be congested but otherwise normal The external wound was then completely closed and the meatus was plugged with a vaselined strip of gauze which was left *in situ* for four days. Six weeks afterwards the wound was completely covered by epithelium and the hearing had returned to normal.

In addition to this case two patients with unilateral multiple exostoses with concomitant middle ear disease of many years standing were operated upon similarly The exostoses in both cases were presumably due to a periostitis set up by the suppurative otitis media Although they did not completely occlude the meatus the drums could not be seen and there was an obvious impediment to the free outflow of the discharge the term hour-glass exostosis applied to this type is very descriptive of the condition Enough of the bony prominences was removed with the aid of a dental burr to ensure a free passage and to get a clear view of the drum In one case (a man aged 47) a polypus was found behind the exostosis emanating from the middle ear This was removed and with appropriate subsequent treatment the ear dried up within five weeks The other patient a man aged 26 had extensive attic granulations which were cauterized Later an ionization treatment was given, the discharge ceased in about seven weeks

* This term is used to include osteoma and hyperostosis

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 6 1937

THE WATCH ON LONDON WATER

Once on a time before the rise to power of the science of bacteriology, chemical methods ruled the field in the examination of samples of water used or intended for domestic purposes, and conclusions as to the safety of such waters were sometimes perhaps over-confidently based upon such considerations as the presence or amount of combined chlorine or nitrogen derivatives Nowadays, while chemical procedures still hold a recognized place, bacteriology has come to dominate the position and much trust is rightly reposed upon the enumeration of indicator bacteria as a guide to the character and degree of pollution present in a water and as a measure of the risk which its consumption may involve

Side by side however with the bacterial content notice had from the first been taken by experts of the minute living things other than bacteria which have their being in water such as algae and animalcules the phytoplankton and the zooplankton as they are called As bacteriology grew in importance for routine examinations the study of these little creatures tended temporarily to decline They might be of interest to the curious, but they seemed to have little significance for practical purposes Nevertheless, in more recent years they have again emerged into a position of some prominence, especially in connexion with large stored water supplies, for the very good reason that they are able by their excessive or unbalanced proliferation, to clog filters or produce changes in the character of waters which attract the notice of consumers and lead to complaints

This biological aspect of water purification has already been represented in successive annual reports on the chemical and bacteriological examination of the London waters In the last report for the time being, the thirtieth,[1] it is discussed by Colonel Harold in a lucid and informative article There are he says, for both the plant and the animal forms two periods of maximum intensity, one in spring and one in autumn The plankton life of rivers is meagre by comparison with that of lakes and impounding reservoirs The impounded water, as it deposits its silt, clarifies and gives free passage to sunlight which stirs the algae to vigorous growth So far as the algae are concerned therefore, it would be better to pass the raw Thames water into supply without impounding it at all Yet the advantages conferred by impounding far outweigh even its propensity to encourage algae It reduces the ordinarily high bacterial count of the raw water It ensures that ample reserve which has already stood London in such good stead and doubtless will again

A careful study has been made of the chlorophyll pigments produced by algae, and a photo electric cell has been devised by means of which these tints as well as the general turbidity of water can be estimated in such a manner as greatly to reduce the personal error Chloramine and cuprichloramine have given good results in the control of excessive algal proliferation but a note of warning is sounded against the too lavish use of algicides Algae, as is well known contribute to the biological film which arrests germs on the surface of sand filters It has been observed that at times when algal growth is low these filters let more bacteria through It is noted also that a deficiency of the silica normally contained in London water has led to the faulty working of base-exchange water softeners as used by some consumers It appears that these evidences of silica shortage in the water coincide with periods of special activity by diatoms, which take silica out of the water in order to build up their frustules We learn with interest though not yet with alarm, that one specimen of the Chinese mitten crab has been reported from the River Thames It is an intermediary host of the Asiatic lung fluke, infestation by which is widespread in the East and in America

All river-derived London waters are now subjected to chloramination Two sources are treated prior to filtration In all other cases the chloramine is applied to the filtered water The normal dose of chlorine for Thames and Lee filtered waters is about 0 25 part per million, for New River filtered water up to 0 2 part per million The standard of purity aimed at for water passed into supply is that *B coli* should be absent from 100 ml The appearance in service of a sample containing *B coli* in 100 ml entails an immediate telephone call to the works concerned, checking of output sampling of filter beds and a stringent inquiry into the control and dosage of chloramine

This is unsleeping vigilance it means safety for the consumer

[1] Metropolitan Water Board Thirtieth Annual Report on the results of the chemical and bacteriological examination of the London waters for the twelve months ended December 31 1935 By Lieut Colonel C H H Harold O B E, M D, Ch B D P H, Director of Water Examination Metropolitan Water Board London P S King and Son Ltd Great Smith Street, Westminster (10s 6d)

atism nine neuritis and one fibrositis Of the twenty one patients eleven have been treated at clinics or hospitals by physical therapy in the form of massage electricity heat etc. One patient No 6 had also suffered injections sinus operation and full dental extraction with no relief The duration of incapacity ranged from a few weeks to over a year and in several instances it was recurrent.

Topographical Distribution of Rheumatism—The sites of pain etc may be grouped as follows neck only four patients, neck and left arm (including two in Group C) seven patients left arm only six patients right arm only one patient The predominance of pain in the left arm as compared with the right is remarkable—namely thirteen patients to one Another point to be noted is that the pain was usually felt on the extreme left aspect of the body—namely, the top of the shoulder and the outer side of the left arm

Discussion

The foregoing demonstrates a method of analysing patients in series The psychological encounters the emotional reactions, and the date of the emergence of the rheumatism are indicated in tabular form Indeed the table may be described as epitomizing twenty one stories each of them with chapter headings which might be entitled (1) I experienced misfortune (2) I took it ill, (3) I felt it sore and stiff In the group used for illustration all ages and all types (spare or fat anxious or placid) were found The time of onset of pain or stiffness during the psychoneurotic illness varied widely between the different patients On occasion swelling of the joints also emerged during the course of the emotional reaction

The true nature of the illness in the group under survey was not recognized and attempts were made in half the patients to rub away the pain with massage, but without success Among the many questions arising out of the investigation of this small group is the following Why should these patients have developed rheumatism in the neck or shoulders or arms especially the left arm? It is not possible to give a full and satisfactory answer to this question in respect of each patient because of lack of data Each patient was seen only once and as a result psychological investigation was necessarily superficial As was previously stated, patients with inferiority (who complained of pain in these regions and who gave a history of previous injury or who had a fear of disease associated with these sites) were excluded from the series under observation Patients Nos 4 and 7, however were doubtful examples of inferiority associated with fear of disease The answer in many of the examples is probably related to the problem of unconscious symbolism Personal pride was a well marked finding in patients Nos 2 and 15, and resentment or obstinacy was very evident in Nos 1 3, 4, 5 8 11 and 13 all of whom had pain in the neck On the other hand, there was a degree of resentment in Nos 19 and 21 and these did not have pain in the neck The predominance of the left arm and shoulder over the right as a site for rheumatic pain is also probably dependent on symbolism.

The Symbolism of the Left Side

The above serial investigation suggests that the left side in the collective unconscious may be associated with ideas related to disaster and misfortune This suggestion receives support from other sources such as folklore and etymology The illustrations from folklore are numerous but only two are quoted here If we spill the salt—which is an 'unlucky thing to do—the evil omens are averted by throwing salt over the *left* shoulder If we dream of a dead person and he holds out his *left* hand to greet us this according to popular dream interpretation is a sign indicating disaster or death As regards etymology it has been observed that in most languages certainly in all Indo European languages (Schrader 1890) the word for left may mean ill omened disastrous, or *sinister* (which is Latin for left)

Note—Recent characterological investigations (Wolff 1932) indicate the association of the left side of the body with the collective (the experience of the species) whereas the right side is more related to the experience of the individual In animals and in men the right half of the face bears an individual expression while the left half—the ancestral type—reveals the expression of the species In saga and in myth the left hand means the magical and the demoniac while the right hand means the good Although certain symptoms are known to predominate in one or other side of the body attempts are not usually made to interpret the significance of such distributions An interesting example of left sided predominance the distribution of tender spots in hysteria is mentioned by Purves Stewart (1924) When not in the middle line they are generally left sided except in left handed patients where they are right sided It is probable that psychoneurotic symptoms on the left side or in the middle line are more commonly associated with the deeper (or species) levels of the mind than those on the right side which can usually be linked up with the personal experience acquired by the individual as for instance inferiority whether relating to structure to fear of disease or to moral transgression

Incidence of Psychoneurotic Rheumatism

Rheumatism is one of the chief labels given to describe the reasons for incapacity for work The morbidity statistics for the insured population of Scotland show that during each year this label is applied to 10 to 12 per cent of all persons incapacitated for work and is responsible for about 10 to 12 per cent of the total time lost from sickness During recent years it has also been noted that the incidence of rheumatism is tending to rise What proportion of cases of rheumatism can be better described as examples of persons suffering from psychoneurotic anxiety state in which such symptoms as pain and stiffness have developed as an episode? It is not possible to give an answer applicable to the general population but that the proportion may not be inconsiderable is suggested by the results found in insured persons examined by a medical referee The reasons for such reference are among others the duration of time the patient has been on the sick list The findings in such samples are not therefore applicable to the general insured population

In a previous inquiry into the incidence of psychoneurosis as a reason for incapacity in insured persons who had been examined by a medical referee (Halliday 1935) it was noted that of 145 consecutive persons labelled rheumatism (including fibrositis lumbago sciatica and neuritis) fifty seven—that is 39 3 per cent—were incapacitated because of psychoneurosis A further investigation into a series of referred insured persons was made and the findings were classified in greater detail The result of this second inquiry not yet published showed that of sixty two consecutive persons labelled rheumatism twenty three—that is 37 per cent—were regarded as being disabled because of psychoneurotic disturbance Of these five were noted to have had structural changes which had subsided but the remaining eighteen—that is 28 2 per cent—were examples of 'pure psychoneurotic rheumatism There is therefore no basis for the opinion sometimes expressed that psychoneurosis is nearly always a superstructure on a real organic illness

A Note on Rheumatoid Arthritis

In three of the patients tabulated in the serial investigation swelling of the joints emerged after the onset of pain This suggests that psychological factors and emotional reaction may have a bearing on the problems of rheumatoid arthritis

There is little literature on this subject Swelling of the joints is known to occur in hysteria Ray (1914) in his excellent book on rheumatism stresses the part played by emotional reaction in rheumatoid arthritis He also notes that among the prodromal symptoms are backward signs of weakness, general debility vague pains dead feelings in the arms and pins and needles in the fingers—symptoms similar to those illustrated in the table and typical of emotional reaction. Ellman and Mitchell (1936) in the recently published second volume of the *Reports on Chronic Rheumatic Diseases* give the results of a serial investigation on the psychological

through the veins, there must be an extensive vasoconstriction elsewhere to compensate for the dilatation of the muscle vessels Mosso demonstrated plethysmographically many years ago that in man the skin vessels constrict, and more recently Barcroft and his co-workers have shown that in the dog the exteriorized spleen shrinks and the exteriorized colon blanches at the beginning of exercise In prolonged exercise, however, although the spleen remains small, the colon flushes again[4] and the skin vessels dilate as body temperature rises, at this stage it is by no means clear whence comes all the blood for the active muscles

Until the last few years there had been no reason to doubt that the vascular adjustments which maintain the arterial pressure through the activity of the proprioceptive reflexes and which occur during muscular exercise are effected chiefly through the sympathetic vasomotor nerves The first doubt came when Cannon[5] showed that the completely sympathectomized cat had a normal blood pressure In the dog[6] the results of this operation are even more surprising, for whereas the sympathectomized cat is listless and apathetic the sympathectomized dog is bright and active, and can run and fight as well as its normal fellow In the sympathectomized dog stimulation of the carotid sinus and depressor nerves fails to produce the usual changes in blood pressure and vascular tone, and the sympathetic nerves seem to be the only vasomotor nerves which in the dog bring about co ordinated vascular adjustments It is probable, therefore, that in such animals the vascular adjustments, which we must assume take place in exercise, are the result of some chemical agent then released In this connexion the recent work of Grant[7] has received less attention than it deserves He showed that in the rabbit the vessels of the sympathectomized ear react more strongly than do normal vessels to a variety of substances such as adrenaline, histamine, pituitrin, and ergotoxine He also demonstrated that in exercise a substance is released which blanches the denervated ear, and that this substance comes neither from the adrenals nor from the pituitary gland

THE NEW YEAR HONOURS LIST

Members of the British Medical Association in all parts of the world will learn with gratification of the honour that comes this week to our Chairman of Council Dr Kaye Le Fleming The knighthood to be conferred on Dr Le Fleming is a fitting recognition of fine work for the profession and the community carried out by a man in busy general practice Long accepted as a leader by his colleagues in Dorset and Hampshire and with a growing influence at Headquarters in London, he enlarged his reputation during five years' chairmanship of the Panel Conference, and then, after three further years as Chairman of the Representative Body of the Association, was called in 1934 to the chair of the Central Council Dr Le Fleming's gift for presidency is known to all who have sat with and under him, he is an accomplished speaker, wise in counsel and resolute in action a medical statesman with a wide view of medicine's duty to the public His Highness the Maharaja of Gondal, G C I E, a medical graduate of Edinburgh, receives the additional high honour of G C S I, and Professor John Fraser, who has held the regius chair of clinical surgery at Edinburgh since 1925 and was appointed surgeon to the King in Scotland last year, is created K C V O Professor Fraser's work on the surgery of children was recognized by the award of the Dawson Williams memorial prize in 1936 The honour of knighthood is conferred also on two distinguished workers in bacteriology and pathology who have long been associated at the Lister Institute of Preventive Medicine, and wrote jointly *The Carrier Problem in Infectious Disease* Professor John Charles Grant Ledingham F R S joined the Lister Institute in 1905, became chief bacteriologist there in 1908, and has been its director since 1930 Dr Joseph Arthur Arkwright, F R S an honorary member of the staff of the Institute, has been a member of the Agricultural Research Council since 1931 Before devoting himself to science he was in general practice for eleven years The knighthood for Dr Henry Morris-Jones, M P, Junior Lord of the Treasury, is in recognition of public and political services He was a general practitioner at Colwyn Bay for twenty years until his election to Parliament in 1929, and was chairman of the Carnarvon and Anglesey Division of the British Medical Association he is now honorary treasurer of the Parliamentary Medical Committee The full list of New Year medical honours will be found at page 283

"SLUM" SCHOOLS MUST GO

A campaign having for its slogan "Abolish slum schools" will be launched at a reception to be held at 4, St James's Square, S W, the London home of Lady Astor, M P, president of the Ten-Year Plan Council on February 15 The guest of honour will be Princess Alice, Countess of Athlone, and Members of Parliament, local government representatives, doctors, and educational and religious leaders will attend The Hon Harold Nicolson, M P, is chairman of the council, and the members include Sir Henry Brackenbury, Sir Norman Angell, Lady Allen of Hurtwood, Dr Sloan Chesser Sir Ernest Graham-Little, M P, the Marquess of Lothian, Sir Arthur Salter and Mr G A Morrison M P The plan was formulated a year ago by seven experts, it called for a ten-year reconstruction scheme for education and urged the special need of improved school buildings, nursery schools, and an extended school life The new council aims by investigation deputations and platform speeches, to persuade the Government and local authorities to put the plan into

aspects of forty rheumatoid and forty arthritic patients The authors approach the problem from the standpoint of the psychiatric specialist and their field of inquiry is directed mainly to the study of the personality types of the various patients They found that twenty seven of the patients with rheumatoid changes (67 per cent) showed a predominance of schizoid features with marked morbid anxiety The paper is important and emphasizes the need for fuller consideration of the mental aspects of disease processes in general and chronic diseases in particular

The cause of rheumatoid arthritis still remains obscure Much work has been done on the physical and micro organic factors of the environment but psychological factors have been largely ignored Lack of appreciation of the meaning of these is perhaps responsible for some of the quandaries of mechanistic research

For example Hench (1936) in a valuable summary of recent American researches on diseases of the joints notes the amount of speculative literature dealing with aetiology and mentions as current theories (1) infection (2) metabolic abnormality (3) circulatory deficiency (4) endocrine abnormality and (5) imbalance of the sympathetic nervous system The last two or three theories he writes may be summarized as follows an endocrine imbalance affects the sympathetics thereby impairing the articular and general circulation general and articular metabolic abnormalities are fostered and arthritis develops with or without the aggravating influence of infection

Although this theory places the primary blame on the endocrine and autonomic systems—the bodily mechanism of emotional reaction—psychological factors are not mentioned in the consideration of aetiology This blind spot is very curious When we are not in the frame of mind to which scientific medicine has accustomed us we all know for instance that a youngster who has lost his penny sheds tears has an increased heart rate and heavy respirations and we acknowledge that these manifestations are evidence of endocrine and sympathetic imbalance We also know that these disturbances usually cease when we give the youngster another penny or failing that distract his attention Further if a medical uncle were to disregard the symbolism of the symptoms (namely I have lost a beloved object) and attempt to find a cure for the boy's bodily disturbances by studying the changes which he would undoubtedly find in the blood sugar the basal metabolism and the circulation we should agree that his outlook was rationalized and could scarcely be regarded as truly scientific Moreover we should expect in virtue of our common human experience that such procedures would tend to prolong and aggravate the boy's bodily disturbances This comment is made not to disparage the inherent value of mechanistic investigations but to suggest that illness is best interpreted as the reaction of an integrated individual to his environment, which includes psychological factors and that to disregard these may cause us to miss the whole point of rheumatoid changes in certain patients

Treatment and Prevention

Treatment depends on two things on recognizing the true nature of the patient's disorder and on knowing how not to make the patient worse Recognition requires (1) the making of a thorough physical examination not only of the site complained of but of the person (2) appreciation of the part which psychological factors play in affecting the body and (3) reframing from discovering structural abnormalities which are not there Regarding the last Mennell (1935) in his useful book *Backache* writes Of this I am sure that if imagination is ready to run riot it is possible to detect abnormalities where none in fact exist. Fibrositis is an

so that it falls below that of the invading organisms Neither deficiency of vitamin A nor lowered serum calcium was considered to be a causative factor The reservoir of the fuso-spirochaetal organisms Dr Clements believes to be the mouth, the mode of transmission—expectoration 27 per cent of Manus sago-eating natives and 15 per cent of the taro eaters had infected gums, promiscuous expectoration associated with chewing is indulged in every few minutes, with soiling of the clothes, fouling of the floor, and consequent infection of wounds on the lower extremity Though he failed, as others have done, to recover the micro-organism in culture, Dr Clements succeeded in reproducing tropical ulcer in 76 per cent of twenty-one attempts, using as his experimental animal rats previously fed for some weeks on a diet low in protein and fat and deficient in vitamin B_2 At the time, the rats exhibited signs of B_2 deprivation as shown by a patchy loss of fur The inoculum consisted of a saline emulsion of ulcer scrapings instilled into these denuded areas of skin after traumatization by cautery Other sections of the paper are devoted to symptomatology, pathology, treatment, etc, the whole forming a valuable addition to our knowledge of the pathogeny of tropical ulcer

THE CAMBRIDGE M B THESIS

The Faculty Board of Medicine has issued a report in favour of abolishing the thesis for the Cambridge M B degree The case for doing so is argued on various grounds In the first place there has been a steady increase in the number of medical students at Cambridge since the war, and if the present rate of increase is maintained the number of M B theses read by the Regius Professor of Physic may soon exceed a hundred a year In addition about thirty M D theses are submitted every year The University has lately approved the establishment of a Department of Clinical Research, and the Faculty Board is convinced that if the Regius Professor is to engage effectively in research and undertake organization and supervision of a research department he should be relieved from the burden thus imposed on him It is of opinion that the requirement of a thesis before admission to the M B degree might be discontinued without detriment to the education of the medical student or loss of prestige

"The period of study required for a Cambridge medical degree is long The majority of medical candidates work for at least one and often two years in preparation for the first M B examination before they come into residence During three years' residence in the University medical students are required to study for a tripos They must be classed in Part I of the Natural Sciences Tripos or in some other tripos, and they must reach the required standard in anatomy and physiology A proportion of students take, in addition, Part II of the Natural Sciences Tripos and a few remain in residence for a fourth year After keeping three years by residence and attaining an honours standard candidates for a medical degree must spend at least three years in the study of clinical subjects at a recognized hospital The majority of students require more than three years of clinical study before they are able to pass the third or final examination At the end of this long period of study and at a time in his career when the newly qualified practitioner should be encouraged and enabled to devote all his energy to the acquirement of the clinical knowledge and experience which the holding of a resident appointment at a hospital affords Cambridge students are required to prepare and write a thesis This thesis is written as a rule at a time when the author has had little opportunity and little time to make original observations and when his general experience cannot be sufficient to enable him to make any substantial addition to knowledge On the other hand the work required for the thesis is sufficient to interfere with the performance of the important duties of a hospital resident Students of all other universities are allowed to proceed to the degree of bachelor of medicine and bachelor of surgery after they have passed the prescribed examinations without presenting theses Consequently Cambridge students who have to wait for their M B degrees until their theses have been accepted, find themselves at a disadvantage The Regius Professor therefore is unwilling to exact too high a standard, and the acceptance of a thesis is almost a foregone conclusion"

As a set-off to doing away with the M B thesis the Faculty Board considers that a higher standard should be required from candidates presenting theses for the M D degree On this matter it will report later Under the present proposals all candidates who have completed the third or final examination will be able to proceed without further test to the degrees of bachelor of medicine and bachelor of surgery, these degrees not being taken separately and their short titles reading M B B Chir Cantab To avoid any hardship, immediately after approval of these changes those who are now bachelors of surgery would be allowed to proceed to the M B upon payment to the University of a fee of £4 women who have received the title of the degree of B Chir being allowed to receive the title of M B upon the same payment While the Faculty Board has made out a fair, indeed a strong case for abolishing the M B thesis regret will no doubt be felt in some quarters that Cambridge should depart from a requirement which distinguished its M B degree from that of all other universities—this at a time when the need for better general education for the medical student is so much in mind The average M B thesis may be worth little or nothing as a contribution to knowledge, but there is something to be said for the collection and preparation of material as a piece of mental discipline Sir Clifford Allbutt, who as Regius Professor read seventy or eighty M B theses and about thirty M D theses a year, wrote "The use of thesis writing is rarely to announce discoveries usually to train the mind of the writer, or to prove that his mind has been trained"

Our *Supplement* this week contains the full list of the officers of Scientific Sections for the Annual Meeting of the British Medical Association to be held in Belfast next July, also the provisional time-table and brief details of accommodation for visitors

The Royal College of Surgeons of England will hold its biennial Hunterian Festival on Monday, February 15 In the afternoon, at 4 o'clock, Professor George E Gask will give a special lecture on "John Hunter in the Campaign in Portugal, 1762–1763" (an account derived from the Loudoun letters recently acquired by the College) In the evening a banquet will be held in the College

men quite unwittingly, may begin by increasing the fears of the patient This is done by supplying the patient with unnecessary technical terms and disease labels, or by ordering physical therapy for structural changes that do not exist A hasty, ill considered diagnosis may fix a neurosis for life (Ross 1929) To use a Biblical metaphor it may let in seven devils where there was only one before Such inadvertent expressions and acts give rise to what have been called iatrogenic diseases —the illnesses created by doctors Further, it should be remembered that conscious concentration on any part or system of the body tends to disorder the function of that part or system This is the basis of certain Yoga practices but there is no need to go to India to study the effect of meditation and concentration on bodily functions!

Motive and Purpose

Many patients with psychoneurotic rheumatism continue to be ill not so much because of the past but because of the future Their emotional reaction prevents them from looking steadily at their environment and thinking out the appropriate action to be taken in the altered circumstances Treatment must therefore be concerned in helping the patient wherever possible to find his future—in relation to finance, occupation and fears of disease So much is clearly within the scope of the doctor

Treatment may also be required in respect of the patient's deep seated emotional attitudes to life and its situations—for example pride resentment obstinacy, self-will These attitudes which must be distinguished from the patient's rationalizations and philosophy are of the kind which have been the particular concern not of medicine but of morals and religion It has been shown that these spiritual attitudes may be reflected in changes in the body's attitude such as limitation of movement and in some instances rheumatoid swellings Indeed there is a suggestion that the spiritual attitude may itself be the disease The detection of such attitudes when they play a part in initiating or maintaining illness is definitely the concern of the doctor but the treatment in our present state of knowledge may require that the patient be guided into the care of the minister or the priest

Conclusion

This paper is a preliminary study of the part played by psychological factors in bringing about such symptoms as pain stiffness and limitation of movement These symptoms in the absence of organic changes are often erroneously labelled by the word rheumatism (or fibrositis neuritis sciatica lumbago myodynia and so on) and are treated by physical therapy Frequently however the illness in which these symptoms emerge is better understood and treated by regarding the symptoms as manifestations of a chronic psychoneurotic anxiety state in which the rheumatism occurs merely as an episode The data on which these conclusions are based were obtained from observations made for the most part on insured persons The paper indicates the manner of investigation and shows how the findings can be interpreted by using the ideas contained in the terms emotional reaction "inferiority and symbolism

Over sixty years ago Charles Darwin wrote The language of the emotions is certainly of importance for the welfare of mankind The implications of this statement are not yet fully realized by the medical profession but statistical studies of patients in series are proving its validity as well as its importance to the problems of prevention Medical students in the past have not been trained to appreciate the bodily manifestations of emotional reaction nor have they been instructed to ask themselves the questions which if asked so often illuminate the meaning and significance of an illness This study is written in the hope that those practitioners who are unaware of this approach to the problems of illness will begin to investigate psychological factors and relate them to the patient's story of his symptoms and the findings of clinical examination By so doing they will discover for themselves how important is the language of the emotions for the welfare of mankind

Clinical Memoranda

Halban's Operation in Occlusion of Fallopian Tubes

In discussing a paper on the operative treatment of sterility at the Gynaecological Congress in Innsbruck in 1922 Halban stated that he had not obtained good results from salpingostomy and that in its place he now merely divided a healthy part of the Fallopian tube between two catgut ligatures As far as I am aware he was the first to suggest tying the tubes as an aid to conception and in a personal communication dated December, 1932 he told me that the results had been satisfactory

My interest in the possibilities of such an operation had been aroused by the numbers of pregnancies which followed so called sterilization by ligature of the tubes with silk In three patients treated in this way I had performed Caesarean sections at the Coombe Hospital and noted the neat appearance of the tubal stumps the freedom from adhesions and the apparently complete absorption of the part of the tube distal to the ligature I therefore resolved to use this method in such cases of sterility due to tubal occlusion as seemed suitable

TECHNIQUE

The technique is as follows After the abdomen has been opened an assistant distends the tubes by the usual means with a cannula in the cervix The operator passes a round needle threaded with fine silk through a blood less area in the mesosalpinx about a quarter of an inch proximal to the site of obstruction The cannula is then withdrawn from the cervix and the silk is tightly tied I have not used more than one ligature on each tube and have not followed Halban's practice of cutting the tube The function of his catgut ligatures I assume to be haemostatic since his custom was to sever the diseased tube from the healthy tube If the tube be not cut at all there is no need for haemostasis and it is hoped that the silk ligature will amputate the affected portion of the tube As an additional aid to this end I have usually tied a second silk ligature round that part of the mesosalpinx which remained attached to the tube distal to the first ligature

sodium is associated with an increased excretion of sodium in the urine

Chlorine (normal 350 mg (as Cl) per 100 c cm of serum)—The chlorides may also be diminished, but to a less degree than the sodium

Urea and Non-protein Nitrogen—In crises and severe phases the urea and non-protein nitrogen are practically always high On the other hand, the blood urea may be normal, although a crisis may be imminent A high blood urea which continues to rise is of serious import

Sugar—The fasting blood sugar is frequently below normal, and there may be a further fall at a crisis It is of little use in assessing the clinical condition, as a low blood sugar may exist with a satisfactory clinical state and normal values may be present in a crisis However, very low blood sugar values—for example, below 60 mg per 100 c cm of blood—are of serious significance, and often occur as a terminal event Some authorities consider that the symptoms of a relapse are due to the hypoglycaemia

Potassium (normal 20 mg per 100 c cm of serum)—The blood potassium may be raised, especially during a relapse A high potassium value is the most reliable chemical indication of the seriousness of the patient's condition

Calcium (normal 9 to 11 mg per 100 c cm of serum)—Blood calcium is usually normal, but when it is raised it is of grave significance

Serum Proteins (normal 5·6 to 8·5 grammes per 100 c cm of serum)—These may be raised in a crisis when there is a decrease in blood volume due to dehydration In the early and chronic states when the patient is not dehydrated, they are usually normal

Basal Metabolic Rate—This is frequently normal but it is often reduced, especially in a crisis, an average figure being about −18 per cent

Gastric Juice—Analysis usually shows hypochlorhydria or achlorhydria *X*-ray examination of the suprarenals may reveal calcification in the tuberculous cases

The most important investigations to be carried out are a determination of the serum sodium serum potassium and blood urea, and an x-ray examination of the suprarenals for calcification

Diagnosis of Addison's Disease

In the diagnosis of Addison's disease other causes of pigmentation, which will not be enumerated here, must be considered Pigmentation in the mouth is a feature of diagnostic importance The abdominal pain may simulate abdominal conditions such as carcinoma, peptic ulcer, and renal disease, but tenderness in the loins in the tuberculous cases may be a differentiating point One of the most important conditions to exclude is carcinoma of the alimentary tract, an x-ray examination and an examination of the faeces for occult blood are often essential, and yet carcinoma may be present although both of these investigations are negative Pernicious anaemia and chronic nephritis with pigmentation, asthenia, and gastro-intestinal disturbances must also be excluded Occasionally toxic goitre especially the so-called apathetic type with marked asthenia mental apathy, pigmentation, low blood pressure, and little increase in basal metabolic rate may closely resemble Addison's disease Cases of Addison's disease without pigmentation may cause considerable difficulty, in these an exacerbation of symptoms may be produced by a salt-poor diet as a diagnostic procedure but caution must be observed as a crisis may be precipitated Other conditions which must not be confused with Addison's disease are neurasthenia, menopausal states essential hypotension, myasthenia gravis, and Simmonds's disease As mentioned above, early and chronic cases may show no change in the chemical composition of the blood but a low blood sodium, which may also occur in conditions in which there is an acidosis, such as diabetes mellitus high intestinal obstruction, and cholera, is a relatively constant finding

Treatment of Addison's Disease

The treatment of Addison's disease may be considered under four headings (1) general measures and the treatment of the underlying disease, (2) sodium therapy, (3) substitution therapy, and (4) treatment of dehydration

GENERAL MEASURES

Rest in bed is necessary until the patients are stabilized on a maintenance dose of salt and/or cortical extract and as they are very susceptible to cold care should be taken that they are kept warm As they have an aversion to fats, and in view of the tendency to hypoglycaemia, the diet should be rich in carbohydrates Because of damage to the suprarenal cortex, which is normally rich in vitamin C, it is as well to ensure that they obtain adequate amounts of this substance Recent work suggests that a diet poor in potassium may be of considerable benefit but details have not yet been worked out When patients are up and about they should avoid infections over-exertion and exposure to cold, as any of these may bring on a relapse

SODIUM THERAPY

In early and chronic cases it is best to start medication by the administration of salt (sodium chloride) The salt may be given in cachets or in milk in 2 to 3 gramme doses (30 to 45 grains) six times daily, the first dose being taken on waking in the morning A disadvantage of this amount of salt is its emetic action in some patients This may be overcome by giving sodium as a mixture of salts—for example, 6 grammes of sodium chloride, 4 of sodium bicarbonate, and 4 of sodium citrate, throughout the day Since there is an excessive loss not only of sodium but also of chlorine in the urine, the mixture should always contain sodium chloride to prevent chlorine deficiency The optimum therapeutic dose is variable The result of this treatment is often a considerable improvement in the patient's condition Appetite, strength, and weight are increased, nausea and abdominal pain are lost but pigmentation is little if at all changed Owing to the general metabolic improvement there may be a slight rise of blood pressure but it does not reach the normal level In some but not in all cases it is possible to restore the electrolyte balance of the blood to normal

SUBSTITUTION THERAPY

The value of sodium treatment lies in the smaller requirements of cortical extract Some patients require no extract at all, others state that they feel better when receiving extract in addition to salt, in others salt may be of no apparent value, and these will need cortical extract as well Those who are in a crisis will certainly require extract, and it is unsafe to defer its administration in favour of salt alone both should be given as soon as possible In a crisis 50 c cm of cortical extract should be injected intravenously, and for the first week it is of advantage to continue its administration by this route (providing no reactions occur), but in successively smaller doses of 30, 20, and 10 c cm The daily dose necessary must be judged by the clinical condition After the first week cortical extract may be given intramuscularly

In cases which respond nearly all the symptoms and signs disappear The pigmentation decreases, but it does not vanish entirely there may be but slight change in the blood pressure The composition of the blood tends to return to normal, with the exception of the hypoglycaemia, on which cortical extract has only a slight effect The

which it is impossible with ordinary histological methods to distinguish between an abnormal epidermic cell and an epithelial cell which has spread into the epidermis from elsewhere Professor Inglis frequently admits this in the pathological accounts of the individual cases yet he denies it in his summaries and conclusions and this weakens his thesis considerably It is curious that no mention is made of the work of Kreibich who claimed that Paget cells have the same peculiar staining properties as the Langerhans cells

The book is illustrated with numerous very fine photomicrographs and a short bibliography is included

RESPIRATORY DISEASES

Modern Treatment of Diseases of the Respiratory System By A Lisle Punch M B M R C P and F A Knott M D M R C P D P H (Pp 296 96 plates 31 figures 15s) London J and A Churchill 1936

Diseases of the respiratory system include a variety of conditions in the treatment of which important changes have occurred in recent years In this book Drs Lisle Punch and F A Knott have attempted to produce something really practical a brief therapeutic survey maintaining a just balance between the indications obtainable from clinical radiological and laboratory investigations Their discussion of the treatment of each disease is preceded by the pathological and clinical argument essential for the proper understanding of the therapeutic measures employed The methods described are up to date and have been chosen with care and the absence of numerous often obsolete alternatives avoids confusion and is to be welcomed The succinct notes of illustrative cases and the clear line diagrams and adequately reproduced skiagrams will be particularly helpful to those for whom the book is primarily intended— the busy general practitioner and the senior medical student who has reached or is reaching the house appointment stage The style is clear and to the point, and does not show the lack of smoothness that might be expected in a two author production Many useful prescriptions are included and full practical details are given when necessary

The book contains much useful advice based on common sense and experience The section on pulmonary tuberculosis however, does not always reflect the most recent and enlightened opinions on the subject The dismissal of the salt restricted diet is hardly justified in view of the good results reported from Sauerbruch's clinic and from America Again the indications for the use of sanocrysin do not accord with those of workers with large experience who would consider the dosage recommended as too small and the indications for complete cessation of its administration as too sweeping The discussion on artificial pneumothorax shows timidity in regard to indications for induction and abandonment and the arbitrary fixing of three years for its duration takes no cognizance of the type or extent of the original lesion

But it is particularly in regard to rest that we would quarrel with the authors The system advocated by them is unfortunately still very prevalent—bed till the temperature drops to normal graduated exercise in a sanatorium for at least six months which is only the first stage in the treatment and then throw the blame on the environment to which the patient returns for any unfavourable results later But the first essential of after care is a clinical cure In Holland where in recent years patients have been kept on strict bed rest for periods of from nine to eighteen months or longer until the sputum has been negative for at least six months results have been obtained vastly superior to those anywhere else Pyrexia is a poor indication of activity and rest must assume a different significance if we are to justify long periods of institutional treatment It is a pity therefore that however impracticable this policy may *appear* at first in view of the present alleged lack of accommodation this factor was not correctly stressed in a book that purports to express modern views Nevertheless the book contains much that is good and will be read with profit by medical students and general practitioners

THE TEACHING OF MEDICAL PSYCHOLOGY

The Place of Psychology in the Medical Curriculum and Other Papers By Sir Walter Langdon Brown Drs R G Macdonald Ladell Frank Gray and F G Crookshank (Pp 63 2s 6d net) London The C W Daniel Co 1936

There are a number of physicians and surgeons otherwise sensible, who believe that a knowledge of psychology comes by nature or, at least that all the psychology that a medical practitioner needs to know either comes by nature or is the product of undirected experience They hold as a corollary that it is a waste of time and energy to give psychology any definite place in the medical curriculum Such teachers view with slight amusement and speak with mild irony about the now prescribed inclusion of the subject in both the pre-clinical and the clinical years of the medical course and they are not a little astonished at the importance attached to such inclusion by the British Medical Association's Committee on Medical Education and by the conference of representatives of various universities and examining bodies They are unlikely to modify their views by reading a brief but within its scope admirable article by Sir Walter Langdon Brown on The Place of Medical Psychology in the Medical Curriculum recently published in a pamphlet on behalf of the Medical Society of Individual Psychology This pronouncement will however be welcomed by the majority of teachers of clinical medicine and surgery and by that large body of general practitioners who having been led to recognize what was lacking in their own medical training as related to the needs of practice are anxious that these deficiencies should be made good for the next generation of students It is true that some persons have a remarkably intuitive sympathy with and insight into, the psychology of others including that of patients and that there are considerable difficulties in the teaching of medical psychology to undergraduates and even dangers in such teaching if given in the wrong way An instruction which is too academic or formal may easily induce boredom rather than interest and the facts that clinical demonstrations of the psychoneuroses have to be given on patients who must be dealt with in quiet surroundings and who are easily alarmed and given to students who have had but little experience of life and its social difficulties present formidable obstacles to the teacher Sir Walter Langdon Brown in his article presents the matter in a true perspective and indicates methods by which these disadvantages may be overcome He supports too the all important statements that such instruction is imperative and that it is welcome

Although such things as compulsional and obsessional neuroses require prolonged specialist treatment the vast majority of neuroses are capable of much alleviation by simpler means The general practitioner who sees the patient in his home environment must, in the long run be responsible for much of this treatment. It is rather pathetic that after all the careful training in scientific method the final outcome should be that so many doctors should be so often inventing diseases because they have not been taught how to recognize and treat neuroses nor how to speak to neurotic

Advantages and Disadvantages of Temporary Treatment

While this analysis is open to criticism in that a much larger number of patients are being dealt with than strictly belong to the class to which the temporary clause applies it may help to demonstrate to those who are unwilling to accept such a class that the latter can be handled without too great administrative difficulties

The disadvantages of temporary treatment chiefly affect hospital administration, and can only be gauged after actual experience For example (1) Regrading of patient has often to take place after a few weeks, twenty-eight days is the time limit stated in the Act after the patient recovers volition (2) If the patient is made voluntary he will often not stay long enough to effect a complete recovery (3) If the patient has to be certified the relatives frequently object and the onus falls on the hospital doctor (4) If extension of temporary treatment is indicated the application has to be sent to the Board of Control within a stated time in order to obtain its consent— not more than one month nor less than fourteen days before the expiration of the current period of treatment" The relative often delays or fails to sign the application, and one has to resort to certification

Two great advantages are gained by temporary treatment (1) certification is avoided by substituting two medical recommendations and (2) the stigma and the inconvenience associated with certification of procuring a justice is avoided and therefore temporary treatment is preferred by the relatives Another advantage is that the mental state of the patient is more closely observed with regard to his future prospects His case is constantly cropping up for discussion pending reclassification, and the question of extension of treatment at the end of six months and nine months calls for close observation

"Good" and "Bad" Types of Temporary Patients

The large number of temporary patients admitted annually (Table I) cover a wide range of conditions Depending on the response to treatment and the progress they make they can be grouped into 'good" and 'bad" types from the point of view of hospital classification In the former category one includes those who become quite clear mentally after a varying period and make an uninterrupted recovery They are fit to be discharged within twenty eight days after regaining volition or preferably continue treatment a little longer as voluntary patients A large number of cases conform to this type, and a few examples illustrating a variety of conditions, are recorded from the admissions during the last year

Case 1—Male single aged 32 was admitted on September 7 1936 suffering from acute alcoholic confusion He was disorientated rambling in his talk and hallucinated—saw golf-balls giving off poison gas and frothing when they reached water Two days later he was quite rational in his talk and behaviour and took his discharge on October 14—five weeks after admission

Case 2—Male single aged 19 was admitted on February 20 1936 in a state of stupor He was mute rigid negativistic, in poor physical condition and had to be fed with all meals He remained in this state for three months but had improved sufficiently to be made a voluntary patient on July 24 Thereafter he had parole worked in the garden, and put on 2 st in weight before taking his discharge on September 22

Case 3—Female married, aged 20 was admitted on December 10 1935 as a case of puerperal insanity Child born on November 5 1935 Confusion with depression Rapid recovery and patient discharged on January 17, 1936

Case 4—Female, married aged 29 was admitted on August 30 1936 suffering from puerperal insanity Child born on August 19 Confusion with great excitement After six weeks—October 16—patient was sufficiently well to go home on trial

Case 5—Female married aged 32 was admitted on November 24 1935 in a confused dazed state with physical and mental signs suggestive of organic brain disease—speech, gait and conduct being affected Laboratory findings were negative and symptoms cleared up rapidly permitting her to be discharged recovered in seven weeks time—January 4 1936

Case 6—Female married, aged 40, was admitted on January 21 1936, in a very toxic state She was delirious extremely restless and hallucinated Temperature 100·6 F pulse 120 Her condition was critical for some days but she improved gradually and was fit for discharge on April 17

Case 7—Female married aged 61 was admitted on February 6 1936, suffering from severe depression She was agitated at times and quite unable to discuss her affairs She improved sufficiently after four months to become a voluntary patient, and took her discharge one week later—June 15

The designation "bad type" can be applied to those who recover fairly well but are not fit for discharge and are subject to relapse Regrading is often troublesome in these cases, and one has to be guided by the history, nature of illness, and home circumstances whether to recommend voluntary treatment or decide on certification It is advisable to have a good knowledge of the patient's attitude and his willingness to continue treatment, for if this is not done before making him voluntary he may demand his discharge in a few days when he is far from well In some of these cases certification is often difficult because the mental symptoms may have improved considerably or are difficult to elicit and the certifying doctor who is seeing the patient for the first time can only submit a weak certificate on 'the facts observed by himself at the time of examination"

The following tables record all the patients discharged and regraded at different periods during five years

TABLE II—*Showing how Temporary Patients were dealt with during the Years 1931 to 1935*

	1931	1932	1933	1934	1935	Totals
Recovered	13	10	16	7	19	65
Relieved or not improved	5	5	5	1	5	21
To voluntary class	4	4	16	26	33	83
To certified class	2	10	1	7	10	30
Died	5	4	10	7	14	40
Transferred	0	1	1	4	1	7
Totals	29	34	49	52	82	246

TABLE III—*Showing Changes in Temporary Patients during the Quarters of the Year*

	Within 3 Months	Within 6 Months	Within 9 Months	Within 12 Months
Recovered	14	42	5	4
Relieved or not improved	7	10	2	2
To voluntary class	10	40	12	21
To certified class	1	4	3	22
Died	35	5	0	0

General Considerations

As a general rule, after the patient has recovered volition one is inclined to give him a chance unless certification is unavoidable Consequently many are made voluntary (Table II) and many leave before their recovery is complete Table III shows the large number of patients discharged within six months Some of these undoubtedly return to hospital, but this need not condemn the system We claim that our hospitals are becoming more like general hospitals, and there the patients do not remain until the physician is absolutely assured of their recovery Many have to complete their convalescence at home or attend the out-patient department, and now patients suffering from mental illness have that advantage as the result of the numerous clinics being established at various infirmaries

It is agreed that Section 5 dealing with temporary patients, is difficult and complicated, but it undoubtedly serves a useful purpose in transient mental illness Con

In *An Ethiopian Diary* (Hodder and Stoughton 5s) Dr J W S Macfie gives a vivid and impartial account of the formation and the work of the British Ambulance Service in Ethiopia The unit was originally intended for the Ogaden front where the author's experience of tropical diseases would have been of much value The Abyssinian authorities however decided eventually to employ its services on the northern front and after a considerable delay entailed by the necessary reorganization and the difficulties of transport an advance was made as far as Lake Ashanghi Dr Macfie writes with admiration of the stoical resignation with which the Abyssinian patients endured pain and discomfort Nevertheless he was disillusioned to discover that despite their courage and brave independence they were not a united people He found them proud intractable and in most cases painfully lacking in gratitude The excellent work which the unit was carrying on was reduced to negligible proportions by one morning's aerial bombardment when much of the equipment was wrecked and the middle of the forty foot square Red Cross ground flag formed the site of a bomb crater Dr Macfie describes the arduous retreat to Addis Ababa whence he was invalided home a few days before the lamentable death of his leader Dr Melly This unpretentious little book illustrated by a series of interesting photographs is one of the best that have been written on the Abyssinian War

A second edition of Dr Bethel Solomons's *Epitome of Obstetrical Diagnosis and Treatment in General Practice* in two volumes (Bale Sons and Danielsson 2s 6d each volume) proves despite what might have been anticipated that these little books have been appreciated It is easy to understand that the Pocket Monographs on Practical Medicine in which series these volumes are included are of value to the practitioner when dealing with subjects concerning which he only needs a rudimentary knowledge but it is not easy to understand how they can be of much service to a man who proposes to practise midwifery The description of the B M A standard (p 107) is inaccurate and in any case it is impossible for the temperature and pulse to rise to 100 F It is not clear whether Dr Solomons advocates the application of the forceps through the incompletely dilated cervix when the cord has prolapsed Further it is difficult to understand why so much space is devoted to the operation of pubiotomy We are of the opinion that Dr Solomons has attempted the impossible but nobody could have done better

The Collected Papers of the Middlesex Hospital Medical School 1935–6 some fifty-two in number have been issued by the Cancer and General Research Committee of the hospital The volume may be consulted in the Library of the British Medical Association

Preparations and Appliances

KNEE RETRACTORS

Mr H Jackson Burrows (London W 1) writes

More often than not the presence of a flange or lip on a retractor to go inside the knee joint is an embarrassment I do not refer to the retraction of the edges of the incision but to the holding aside of extra synovial fat pads projecting within the knee during the examination of the cartilages and other structures To accomplish this adequately in the central part of the joint requires a wide blade whereas only a narrow one can be inserted peripherally for what may be considered an adequate distance In the inspection of a semilunar cartilage or the removal of the marginal part of a torn one it is an advantage to have the narrower blade curved to suit the margin of the tibial condyle An unskilled assistant tends to let the handle of the retractor fall into the coronal plane so that the blade comes to lie in the sagittal plane where it is not only ineffective but obstructive This difficulty may be overcome by setting the blade at an angle of about 45 degrees with the shaft so that when the assistant retracts in approximately the coronal plane the blade lies in the position required The handles of retractors are often too small for the comfortable maintenance of grip with the gloved hand With these thoughts in mind I experimented with various modifications of Nystrom's retractors a sample of which I had seen Mr S L Higgs use in a knee and finally evolved the pair of instruments shown in Fig 1 That with the narrow curved blade (A) is used for the periphery that with the broad straight blade (B) is used for the central part of the joint and for retracting the ligamentum mucosum during inspection of the front of the compartment opposite to that directly opened I have to thank the Genito Urinary Manufacturing Company for their ready help in all the stages of experimental instruments and for the production of the final model

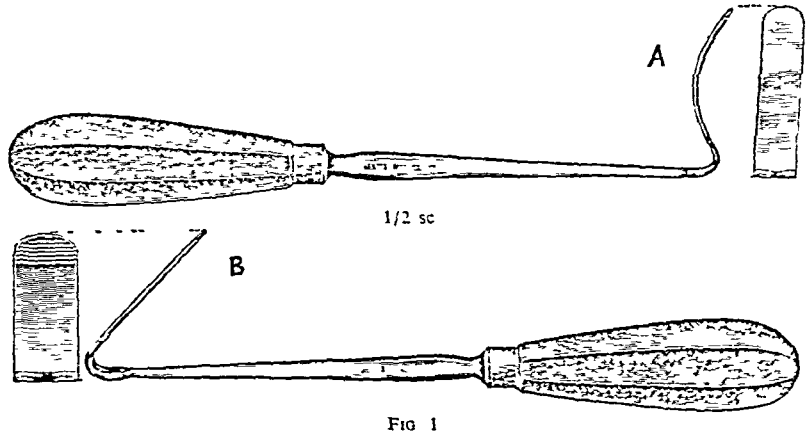

Fig 1

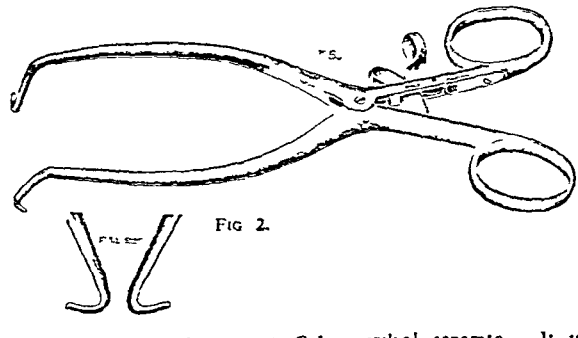

Fig 2

For the superficial part of knee and other orthopaedic operations I have found useful the self retaining retractor shown in Fig 2 a modification of Gelpi's vulsel separato It is preferable to Traverse's or Weislander's retractor usually adopted because the single blunt prongs can be more precisely inserted in the correct layer and the cam action allows smoother and more accurate adjustment This instrument has been made for me by Messrs Down Bros

CHILD GUIDANCE INTER-CLINIC CONFERENCE

Under the auspices of the Child Guidance Council the third biennial inter-clinic conference of representatives and professional members of stafis of child guidance clinics was held in London on January 29 and 30 Nearly forty clinics were represented, and useful sectional discussions took place on such subjects as the clinic is a social and educational centre in the community, the problems of remedial teaching, the physiotherapy of the difficult child, and the organization of research into common child guidance problems

General Meeting

Presiding over a general meeting in the Great Hall of the British Medical Association House, Dr C S MYERS, principal of the National Institute of Medical Psychology, said that "child guidance clinic" was loosely defined, but he thought it could be taken that when only one doctor in a hospital looked after nervous disturbances of children he was not qualified to call his work a clinic, the word should be used in the American sense of a team, and in addition to those who treated the cases directly a social worker was necessary for visiting the homes and finding out the difficulties Ideally in a properly equipped clinic there should be at least two persons treating the young patient—namely, the medically qualified expert in mental disorders, and the psychologist, who was generally not medically qualified A clinic by no means confined its work to children of low intelligence, many of the children were indeed above the average They might be divided into three categories first, the cases exemplified by disorders of movement, night terrors, incontinence, obsessions, conditions of severe depression or excitability, secondly, cases exhibiting insubordination, truancy, inattention, and backwardness, and thirdly, cases with moral defect habits of destructiveness, untruthfulness, and theft Dr Myers also referred to the lack of training of the average general practitioner for dealing with cases in which there was an element of mental disorder In his own student days there was no teaching on functional maladies of this kind, hysteria was looked upon as a disease of the imagination, and, as one of his own teachers said, "Imaginary diseases require imaginary remedies" The General Medical Council now ordained a certain amount of psychiatry in the curriculum, but only enough to enable the student to learn how little he knew

Mr GEOFFREY SHAKESPEARE, M P, Parliamentary Secretary to the Board of Education, brought the good wishes of the Board for the success of the child guidance movement Local education authorities could run their own clinics and apply to the Board for a 50 per cent grant, or they could contribute to a voluntary clinic, or pay the fees of council school children attending But this was not a service to be imposed from Whitehall, no "mass production" methods could be applied, and it was of all services the most individual

Selection of Cases for Treatment

Of the sectional discussions the most largely attended was one presided over by Dr R G GORDON of Bath on selection of cases for treatment After Dr MILDRED CREAK and others had introduced the subject, Dr GORDON in suggesting the lines of general discussion said that one of the difficulties from which child guidance clinics suffered was that a great deal of time was taken up in sorting out the cases and in the preliminary advisory work Could nothing be done to enable that sorting out to take place before the child was actually brought to the psychiatrist? It was a question whether in large towns, where more than one clinic was available it might be useful for one of the clinics to specialize in sorting out and advisory treatment, and the other in intensive psychological treatment The latter could not be given in a busy environment with a pressure of miscellaneous cases The question of intensive psychological treatment raised the point as to how far it was possible to change the child's personality A child was very much more suggestible and plastic than an adult On the other hand, if the immediate symptoms were removed, these generally being expressions of emotional conflict, this very plasticity enabled adjustment to take place, and often there was no further trouble Dr Gordon added that the intensive treatment of psychosis in the adult was disappointing and sometimes harmful, because the psychotic was suffering from a biological deviation, not simply emotional conflict, and by the time adult life was reached that deviation had proceeded far and was difficult to reverse In the young however, it might be possible to give treatment with the object of correcting the deviation He also referred to the tendency to treat preferentially the intelligent child who was more interesting and co operative, while possibly it was the backward child who was the more important From the recent report of Sir Arthur MacNalty it was made plain that the Board of Education did not wish children to be sent to special schools unless this course was absolutely necessary Once a child was sent to a special school it was marked for life

Child Guidance Work and the General Hospital

Another session was concerned with the relation of child guidance work to the general hospital Dr HILDA STOEBSIGER said that only in the hospital was there really adequate provision for examination of physical function The physical examination at an isolated clinic was likely to be scrappy and inadequate owing to poor equipment for such work In treatment there were many cases in which very close co operation between those treating the physical and psychological aspects of the case was essential as for example, in cases exhibiting behaviour disturbance accompanied by chronic disease such as diabetes mellitus Beds were also a valuable adjunct for it was only when the psychiatrist was able to treat selected cases in hospital that he could form an opinion as to the child's reaction to home environment

Dr T A A HUNTER of Plymouth, while alive to certain advantages of the hospital clinic one being that it would promote a child guidance outlook among the medical staff stressed certain disadvantages It would be a great pity if as a result of hospital association the child referred to a child guidance clinic should be regarded as a sick child Children should be referred not as sick persons but as those showing a certain abnormality in development which could be put right The clinic should have its preventive aspect chiefly emphasized, whereas too close a connexion with hospital practice would give it a curative outlook This speaker did not think it would be possible to staff child guidance clinics permanently on a voluntary basis, although the voluntary system obtained in the hospital The development of child guidance should be on the basis of educational rather than of hospital service

After discussion in the several sessions the directors and representatives of clinics met to receive the various resolutions and to deal with questions arising therefrom

---

K Oxenius (*Munch med Wschr* December 18, 1936, p 2082) states that during an epidemic of influenza at Chemnitz in November, 1936, whole families were attacked Under suitable treatment recovery took place in two or three days About 10 per cent of the children had a relapse two or three days after recovery from the first attack, most of them being young infants Oxenius attributes this occurrence to the fact that owing to the mild primary attack relatively few antibodies were formed especially as the patients were infants, and a fresh infection readily took place in a few days

PROBLEMS OF CARDIOVASCULAR REGULATION

The chief function of the circulation is to supply blood to the tissues according to their varying needs but if we turn to the textbooks of physiology to find out how this is achieved we are apt to be disappointed It is refreshing therefore, to find the subject of cardiovascular regulation dealt with in two recent addresses Professor Anrep in his Lane Lectures to Stanford University,[1] considers exhaustively four questions to which he has himself contributed largely—namely, the proprioceptive mechanisms regulating cardiovascular function the relation between respiration and heart rate, the coronary circulation, and the muscular circulation Professor McDowall's presidential address to the Section of Physiology of the British Association *in 1936 dealt chiefly with the circulatory changes* during exercise As he remarks, the factors in cardiovascular regulation are complex, so complex that the main issues tend to become obscure Nevertheless the researches of the last two decades have done much to clarify conceptions on certain points and to reveal the depths of ignorance on others For knowledge of the part played by the heart in cardiovascular regulation we are greatly indebted to Starling He and his co workers showed that the output of the heart is determined, within wide limits, by the rate of inflow of blood from the veins, which in turn depends on the relationship between a relatively constant factor the blood volume, and a more variable factor the capacity of the circulation Ordinarily, therefore changes in the output of the heart are determined by changes in the capacity of the circulation—that is to say, by changes in tone of the blood vessels generally and in the size of the spleen Since the proportion of the cardiac output that is distributed to any organ depends on the tone of its vessels relative to that of other vessels in the body it is evident that the circulation is to a great extent regulated by changes in the vessels the heart as a well disciplined servant dutifully ejecting blood into the aorta as fast as it receives it from the veins

There are two chief problems in vascular regulation How does the functional activity of an organ produce vasodilatation locally? And how is general vascular tone altered in order to adjust the output of the heart to the varying needs of rest and activity of the individual organs? It has long been recognized that dilatation of the vessels supplying an active organ is probably due to the action of chemical substances released during functional activity The first clear demonstration of this is, however quite recent Anrep and his co workers have shown that blood collected from the contracting gastrocnemius produces vasodilatation in that muscle when perfused through it again Surprisingly enough, for muscles contain relatively little, the active agent appears to be histamine or something very like it It has also been shown that something resembling histamine is released into the coronary blood stream of the contracting heart and that the greater the heart's work the greater the amount of the substance released To what extent the other vasodilator substances found in tissues contribute to the local vasodilatation accompanying functional activity is still uncertain The part played by the nerves is also obscure The effect of the local vasodilatation accompanying activity should be to reduce arterial pressure and to diminish the cardiac output owing to the increased capacity of the circulation Actually the arterial pressure does not fall and the cardiac output increases, because adjustments occur in the vessels elsewhere in the body These adjustments probably take place through the activity of reflexes arising from sensory organs which are located in the vascular system itself in the arch of the aorta and the carotid sinus as the origin of the internal carotid artery is termed A rise of blood pressure in either of these sensitive areas induces reflexly a slowing of the heart and generalized vasodilatation whereas a fall of blood pressure produces quickening of the heart and generalized vasoconstriction, the reflex effects thus tend to antagonize any change in arterial pressure and to maintain this at a steady level These reflexes are in constant activity, as has been shown by recording the impulses ascending the carotid sinus and depressor nerves and by the persistent tachycardia and rise of blood pressure which follow section of these nerves With the recognition of their importance in regulating the arterial pressure came the hope that high blood pressure in man might be due to a suppressed activity of these reflexes This hope has however, not been fulfilled for recent work[2 3] indicates that at least the carotid sinus mechanism remains active in essential and nephritic hypertension

The most profound circulatory changes occur in muscular exercise As Krogh so clearly showed the number of open capillaries in an active muscle may be twenty or more times as great as in a resting muscle In spite of the enormous increase in the capacity of the circulation which this must produce, the cardiac output may rise in man from 5 to 30 litres a minute and the arterial pressure also rises Although part of the increase in cardiac output is due to the pumping effect of muscular contractions on the flow of blood

early effect and to inform the general public of the benefits that such reconstruction would bring to the children of the country Special attention will be given in view of the new physical fitness campaign to a national campaign for the improvement of unsatisfactory school buildings for the abolition of 'slum' schools for better nutrition of school children and for the provision of more nursery schools A special committee will devote itself to urging the need for school canteens to tackle the problem of securing the adequate nutrition of all school children Mr R D Denman M P is chairman of a subcommitteee to deal with the interests of young people between 15 and 18 and Dame Rachel Crowdy of a nursery schools subcommittee The council holds the view that right environment is the only effective way to health More than a million teachers students, doctors and education and social welfare experts are represented on associations which are to co operate in putting the plan before the public and the governing authorities The offices of the Ten Year Plan Council are at 40 Palace Street S W 1

DIABETIC RETINITIS

The introduction of insulin has added little to the elucidation of diabetic retinitis and nothing at all to its treatment there is hardly an aspect of the problem on which any positive agreement has been reached The incidence of retinitis in diabetics has been estimated as low as 2 per cent by Poulard and as high as 50 per cent by Kirby Writers who report large series of cases agree to an incidence of 10 to 15 per cent but the criteria for diagnosis vary with different observers Some diagnose diabetic retinitis on the presence of a few punctate haemorrhages in a patient with diabetes others disregard such findings as diabetic and consider them to be signs of vascular degeneration occurring in diabetics—this, in fact is the general view and some hold that there is no such entity as diabetic retinitis It is difficult to correlate the degree of fundus changes with the severity of the disease Indeed there is good evidence to support those who hold that retinal complications are more apt to occur in the milder forms of diabetes The contention that retinitis only develops after some years is also questioned Thus R Braun [1] in a series of 111 cases of diabetic retinitis found that the duration of the diabetes in thirty four of his patients was less than five years The old view that diabetic retinitis occurs only in elderly patients cannot be accepted as a general rule for of late years an increasing number of cases have been reported in young patients Even on sex incidence there is no agreement Leber thought the condition to be commoner in men but Hirschberg gave a ratio of 7 to 3 in favour of women Attempts to simplify the problem by differentiating special forms of diabetic retinitis each with its characteristic appearance have not led to the desired simplification They have only raised a well justified controversy as to the validity of these subdivisions Extensive and elaborate work on the biochemical aspect of diabetes has also thrown little light on the problem It is clear that there is no correlation between fundus changes and glycosuria and blood-sugar concentration Less conclusive is the relation to ketone bodies and acidosis a direct relation can indeed be excluded but what is not clear is whether intermediate substances may not play a part Rather similar is the position with regard to the products of lipoid metabolism Blood calcium which at one time attracted much attention, seems to be a factor of no significance Most clinicians attach much importance to changes in the retinal blood vessels as factors in the production of diabetic retinitis but here too we find no agreement There is to begin with the larger problem of the significance of vascular degeneration in diabetes and the question of the evaluation of minor vascular changes in the retina The view held at one time that vascular hypertension is an important factor has not been substantiated for many patients with diabetic retinitis do not suffer from high blood pressure Still more disputed is the relation to kidney lesions The mass of literature on the subject of diabetic retinitis is thus highly inconclusive The field is however gradually being narrowed by the elimination of untenable hypotheses Yet whether the truth is contained in this narrowed field is a matter of doubt The key to the problem may well lie in the local metabolism of the retina itself but our ignorance of this is profound

TROPICAL ULCER

Tropical ulcer under a multitude of local synonyms has long been recognized by medical men practising *in warm countries as a disease causing much invalidity among natives* of the tropical belt and as one therefore of considerable economic importance Although in the last few years the causal relation between a spirochaete and a fusiform bacillus and the ulcer has been generally accepted many gaps in our knowledge still remain and it had been suggested that other factors probably play a part in the aetiology of the condition including trauma debility and dietetic deficiency or imbalance An interesting contribution to the subject has recently been made by F W Clements [1] based on observations made in Manus the largest island of the Admiralty Group and on experimental work carried out at the School of Public Health and Tropical Medicine Sydney As the result of field observations he concludes that age sex and race play no essential part but that there is a seasonal incidence associated with the monsoon Debility due to co existing infections as a predisposing factor is not proved On the other hand trauma is aetiologically significant The distribution of the disease was found to be correlated with native dietary Two groups of peoples were distinguished the one subsisted largely on sago the other upon taro (*Colocasia antiquorum*) The mean percentage incidence of tropical ulcer among the two groups was 5 3 and 2 5 respectively The higher incidence among the sago eaters is believed to be due to their *diet being rich in carbohydrates low in* fat poor in protein and deficient in vitamin B$_2$ which acts by lowering the reduction potential of the tissues

NOTES OF THE WEEK

Joint Committee of the B M A and the T U C

An important development was reported in the Proceedings of Council, which appeared in the *Supplement* of January 30 (p 49) The Council of the Association has agreed with the General Council of the Trades Union Congress to set up a joint committee on medical questions Its terms of reference will be as wide as possible, each side being free to bring forward for the consideration of the committee (which will be purely advisory in character) any relevant question upon which it desires its advice The autonomy of the Association and of the General Council of the T U C will be in no way impaired, though each will naturally seek the views of the joint committee on questions of mutual interest It is likely to consider such general questions as the provision of a general medical service, contractual arrangements between doctors and workmen, the development of industrial medicine, and specific questions as they arise The joint committee will further provide, either directly or through a sub committee arbitration machinery in industrial disputes It will consist of seven representatives from each side and the first meeting will take place on Thursday February 25, at B M A House It is believed that a ready interchange of views between the medical profession and trade unionists can only result in mutual good in the public interest

Clearing House for London Voluntary Hospital Cases

The Voluntary Hospitals Committee of the County of London is considering a proposal for the establishment of a central office to facilitate the admission to voluntary hospitals of emergency and acute cases The office would be able immediately to tell a practitioner who is in urgent need of a bed for a patient where to send his patient, and to warn the hospital of the arrival of the patient Of the ninety four hospitals which have replied to a circular inviting opinions on the scheme sixty one have expressed their willingness to co operate if the scheme should be established and three have expressed their dissent

Investigation of Proprietary Preparations

At a recent meeting of the conference of representatives of the Science Committee of the Association and representatives of the Pharmaceutical Society further consideration was given to the possibility of setting up machinery for the investigation of those proprietary preparations which are advertised to the medical profession The conference received an interim report on two trial investigations—of the ovarian extracts and of local anaesthetics—which it instituted some months ago The feasibility of investigating the whole class of proprietary remedies under consideration and of publishing a list of approved products for the guidance of the doctor and of the pharmacist is still uncertain, but it is hoped that when the present experiments have been completed it will be possible to devise a practicable scheme

Public Medical Service in West Norfolk

At a meeting of medical practitioners recently convened at King's Lynn by the West Norfolk Division of the Association it was unanimously decided to establish a public medical service for the area of the Division

---

Dr Leonard Kidd has resigned from the post of medical superintendent of the Fermanagh County Hospital which he has held for forty years

THE MEDICAL SECRETARY'S VISIT TO INDIA

The following notes, dated January 11 and 18, have been received by air mail from Madras and Calcutta In them Dr G C Anderson gives a brief account of part of his visit to India, 1936–7

These few notes of my experiences since leaving England on November 26 may be of interest to those members who are aware of the fact that the Council of the Association has sent me on a mission of inquiry to India After an uneventful sea trip from Marseilles to Bombay my wife and I arrived at the Gateway to India some hours late on the morning of Friday, December 11 Although the boat arrived at the early hour of 6 45 a m, representatives of the Council of the Bombay Branch headed by Major S K Engineer, president of the Branch, Dr B B Yodh, honorary secretary, and Mr V L Parmar representative at the Annual Meeting at Oxford, welcomed us outside our cabin door From that moment until the present I have had little respite I have travelled thousands of miles, addressed numerous meetings talked with Governors, Commissioners, and Administrators, as well as medical men and women in all branches of medical work I have visited hospitals, medical schools welfare centres, and other places of medical interest, and I have taken every opportunity afforded me to become acquainted with the problems of medical practice and organization in this vast country Everywhere I have met with the greatest cordiality and kindness, and every effort has been made to enable me to study the problem which the Council instructed me to investigate

In Bombay and Delhi

In Bombay I was shown the more important medical institutions the J J Hospital by Lieut Colonel S S Vazifdar I M S , Bai Motlibai Hospital, by Lieut-Colonel W C Spackman, I M S , the Grant Medical College by Lieut-Colonel S L Bhatia, I M S Nowrosji Wadia Maternity Hospital by Sir Mangaldas V Mehta K E M Hospital and Seth G S M College, by Dr Jivraj N Mehta Jerbai Wadia Hospital for Children, by Dr R N Cooper E G Hospital, by the Surgeon-General of Bombay, Major General E W C Bradfield At a number of these institutions an opportunity was afforded me to discuss many problems with the medical men associated with them I addressed the profession of Bombay in the Grant Medical College on the purport of my visit, and was entertained to lunch by the Council of the Bombay Branch and, on another occasion, by the Bombay Medical Association North, with the president, Dr M S Bathiwalla, in the chair The numerous interviews I had with medical men while I was in Bombay were of the greatest interest and value to me

We left Bombay on the evening of Tuesday, December 15, for Delhi, which we reached next day at 10 30 p m Delhi, the town of many dynasties, to which so much stormy history is attached, can boast a new and up to date hospital with a modern air-conditioning plant This institution—the Irwin Hospital—is administered by Lieut Colonel W C Paton, I M S, who was my "guide, philosopher, and friend" during our short stay in Delhi I addressed a representative gathering of the medical profession and called upon a number of medical men practising in the city, as I was anxious to see for myself the conditions under which the independent medical practitioners carried on their work I visited a municipal dispensary in the city, where an enormous number of patients are seen daily Through the kindness of Lieut-Colonel P J Ryan,

ENDOCRINES IN THEORY AND PRACTICE

This article is one of a series on Endocrinology contributed by invitation

ADDISON'S DISEASE AND SUPRARENAL INSUFFICIENCY

BY

A. W. SPENCE, M.D., M.R.C.P.

Addison's Disease

Since Addison described in 1855 the syndrome which is due to destruction of the suprarenal glands little has been added to knowledge of the essential pathology of the condition. The cortex, but not the medulla of the suprarenals is necessary for life and the fundamental cause of death is deficiency of cortical secretion. Lack of cortex is responsible for most of the clinical findings, but it is probable that deficiency of medullary secretion also plays a part in the production of features such as pigmentation, hypotension, and hypoglycaemia.

Aetiology

Addison's disease may occur at almost any age, but it is very rare in children, its incidence is most frequent between the ages of 30 and 50. It is said to be more common in men than in women. In most cases the condition is caused by tuberculosis of both suprarenals usually associated with tuberculosis elsewhere (for example in the lungs) although this is often clinically latent. According to different reports tuberculosis accounts for 70 to 90 per cent. of cases of Addison's disease the bulk of the remainder being due to simple atrophy of the glands. In this country however atrophy is probably as common a cause as tuberculosis and is more likely to be responsible for the disease in women aged 35 to 45 and at the climacteric. Other but rare causal conditions are syphilitic fibrosis, amyloid disease, and very rarely, malignant disease.

Clinical Features

Some authors describe three stages: (1) the early or latent phase which clinically cannot be recognized as Addison's disease and may be diagnosed as influenza, (2) the classical syndrome, and (3) the terminal phase which presents the features of collapse. The symptoms which may arise during the second stage are manifold. Among them may be mentioned asthenia, faintness, insomnia, restlessness, anorexia (especially aversion to fat), nausea, vomiting, intermittent diarrhoea associated with intervals of constipation, epigastric discomfort, abdominal pain and tenderness in the loins, yawning, hiccups, pigmentation, conjunctivitis, psychological changes (especially depression), loss of weight, scanty menstruation or amenorrhoea, loss of libido and impotence.

Early symptoms may be anorexia, nausea, vomiting, and epigastric discomfort or depression, asthenia, insomnia and loss of weight or pigmentation only, which in very chronic cases may persist for many months before any other manifestations present themselves. In children gastro-intestinal disturbances are prominent.

The pigmentation appears chiefly in those parts of the skin which are continuously exposed to sunlight, in those subjected to more or less continuous pressure by articles of clothing, and in those normally more heavily pigmented than the rest of the body—for example, the axillae, the areola of the nipples, the linea alba, and the genital and anal regions. It also occurs characteristically in the mucous membrane of the mouth where it has a bluish tinge—especially at the inner aspect of the cheeks, tongue, palate and gums—and in the skin of the labia but not in the rectum or vagina. It is often seen round the edges of scars but not in the scar tissue itself, and is often associated with dark brown or black pigmented spots or freckles and occasionally with leucoderma. In acute cases pigmentation is frequently absent.

These patients have a marked sensitivity to cold and drugs, a poor resistance to operations and shock, and a susceptibility to infection. The body temperature is usually subnormal. The heart may be diminished in size, the sounds faint and distant, and the pulse of poor volume. The systolic and diastolic blood pressures are almost always low, the systolic being below 90 in the early stages; however, the blood pressure may be normal. The urine may contain a slight amount of albumin and occasionally casts.

In the chronic cases remissions and relapses occur. During a remission, which may last for weeks, months or even years, the blood pressure commonly remains low, although the other features of the disease improve considerably. Patients are very liable to crises which are heralded by increasing weakness, psychical disturbances, nausea, vomiting, deepening of the pigmentation and fall of temperature and blood pressure. In a severe crisis the asthenia and vomiting are extreme, there is marked loss of weight, the systolic blood pressure may be below 70 and there may be suppression of urine; in other words the patient is suffering from collapse and dehydration which some observers consider responsible for the symptoms. Death usually takes place in one of these crises. They may be precipitated by undue exertion, exposure to cold, a slight operation or an infection, or they may come on for no apparent reason, in which case they may be due to further damage to the suprarenal cortex. The duration of life is longer and severe crises are less frequent in those with marked pigmentation, little asthenia and few gastro-intestinal symptoms. The most important single prognostic index is body weight: those who eat and gain in weight do well.

Laboratory Findings

Addison's disease well illustrates the maxim that the clinician should not rely on the laboratory findings for his diagnosis or prognosis. In the early stages of the disease and in chronic cases the composition of the blood may be quite normal, and a threatening relapse may be forecast more from the clinical condition of the patient than from a detailed analysis of the constituents of the blood. The laboratory findings however are of interest and often of use in confirming the diagnosis and the clinical concept of the degree of suprarenal insufficiency.

Blood Cells.—There is often an anaemia but this may be masked by the increased concentration of the blood as a result of the dehydration brought about by vomiting, diarrhoea and failure of cortical function. There may be a moderate eosinophilia and a relative lymphocytosis.

Sodium (normal 25 mg. per 100 c.cm. of serum).—Blood sodium is usually low particularly in the acute cases and in crises but it may occasionally be normal especially in the early and chronic cases. The clinical condition is roughly parallel to the level of the blood sodium. The low blood

rescue homes, and clinics, and to see weaving and carpet making Indian ladies have welcomed her to their homes, and she has had many informative conversations with them There is not much chance of any idle time, because a surprising amount of correspondence has to be dealt with at every place, and this usually occupies every spare minute One thing I may mention we have received almost constant attention from mosquitos, evidently they are able to spot newcomers

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

Professional Secrecy Examination and Consent

The general principle which should guide a medical practitioner is that he should not without his patient's consent, voluntarily disclose information that he has obtained from the patient in the exercise of his professional duties It is essential that for the proper rendering of professional services there should be established a relationship of complete confidence between one who receives and one who renders the service

Gossip by practitioners respecting the cases under their care should rigorously be avoided 'A medical practitioner must not discuss the ailments of his patient with a third party without the patient's consent and he must keep silent concerning anything that he has seen or heard which it would be improper to divulge If a third party requests information as to the nature of a patient's illness the inquirer should be referred to the patient's friends

It has been urged from time to time that doctors should volunteer information which would lead to the discovery of a crime such as the procuring of abortion Any such suggestion should be strenuously resisted in the belief that nothing should be done to prevent anyone who is ill from consulting a doctor in the fullest confidence that his secret, even if it be that he has been concerned in the commission of a crime will not be reported to the authorities If the doctor suspects that a crime has been committed—for example if he suspects that a husband is being poisoned by his wife or vice versa—he should either insist upon a consultation with another practitioner at the bedside, get the patient as soon as possible removed to a hospital, or confidentially state his suspicions to some professional friend, preferably one holding some official position in the neighbourhood or to the Medical Secretary of the British Medical Association in order that the responsibility for any divulgement may be shared Important facts in such cases can often be learned by chemical examination of vomit, urine, and faeces, and such examination should never be omitted Cases of this sort are of course, very rare but if and when they do arise the practitioner will be well advised to follow suggestions given here

The maintenance of professional confidence is essential in the public interest but it is when the evidence which a doctor may be called upon to give in a court of law is considered that difficulties are encountered There is no privilege allowed in English courts of law respecting the communications made by a patient to his medical attendant such for example as that conceded to those from client to solicitor but a medical practitioner should always preserve the secrets which have been entrusted to him in his professional capacity, and should, except with his patient's consent answer questions only at the express direction of the judge Unless his patient agrees the doctor should not answer questions put to him, before his appearance in a court of law, by policeman, solicitor, or other person (or in Scotland in "precognition"), and even when he has his patient's consent he should take care to see that his patient understands what may be the effect of the information he is asked to give

A medical man may be asked when in the witness box to reveal matters which he has learned in the course of his attendance upon a patient, and which he rightly regards as professional secrets The court will not allow him to plead this reason for refusing to answer, and his proper course should be to object to tell his patient's secrets and to appeal to the judge The judge will not direct him to answer unless he believes it necessary in the interests of justice If a judge directs that the doctor must tell what he knows, and if the doctor refuses, he is liable to be found guilty of contempt of court and punished accordingly A refusal to obey the order of the judge in this connexion can be justified only in very exceptional circumstances, and as a general rule a medical witness would be well advised to obey the order of the judge It must of course be realized that there may be circumstances in which a medical witness would be acting in accordance with the highest principles of medical ethics by refusing to obey the judge and taking the consequences but this serious step should only be taken after consultation with those who are competent to advise

INSURANCE MEDICAL SERVICE WEEK BY WEEK

"Pregnancy" Following Confinement

It would seem unnecessary to point out that it is misleading and improper to enter "pregnancy" as the incapacitating condition on a certificate covering incapacity after confinement, but there are recorded cases where this has been done, surprising though this may appear What perhaps is a little more surprising is that arguments have been seriously put forward before a Medical Service Subcommittee to the effect that confinement and post-confinement conditions were a sequel to pregnancy and that this was a correct description of the disabling condition In the following extract from the minutes of the Medical Service Subcommittee for a county area the practitioner did not seek to justify the action of his assistant, and the subcommittee was content to find that the assistant had shown carelessness in certification and had committed a breach of the medical certification rules

> The subcommittee considered a complaint by an approved society that one of its members had informed the society sick visitor that she went to Dr E to get a bottle of medicine and that his assistant Dr W, gave her an intermediate certificate on Form M D 40, certifying that he had examined her on August 5 1936 and that in his opinion she remained incapable of work up to and including that day by reason of pregnancy The member was confined on June 30 1936 The society's view of the matter was that the certificate was given without examination The respondent Dr E who did not attend before the subcommittee wrote stating this happened while he was on holiday He admitted that the member was confined on June 30 a fact which was known to them as she received attention in the maternity home while resident there She came to the surgery on August 5, and appeared to Dr W to be

basal metabolic rate is raised only if it was previously low Results begin to be apparent in from two to four days With improvement in the patient's health and strength the extract may be gradually reduced until the maintenance dose is reached This varies from 1 to 5 c.cm. twice daily In time it may be possible to stop the administration of cortical extract for some months but this should not be attempted until the patient is gaining in weight Treatment with sodium should not be discontinued Progressive tuberculous lesions and secondary infections will call for increased dosage of extract

If a crisis be protracted and in the chronic or stationary period of the disease cortical hormone exerts no striking clinical effect and one's enthusiasm should not allow one to overlook the fact that patients have died in spite of large doses of cortical extract Salt and cortical extract are not panaceas in the treatment of this condition

TREATMENT OF DEHYDRATION

It is considered by many that the symptoms of a crisis are due largely to dehydration and by others to hypoglycaemia Energetic measures should be taken to combat these conditions In a crisis 500 c.cm. of a 5 per cent solution of glucose in 5 or 10 per cent saline should be injected as soon as possible intravenously and repeated if necessary during the next few days The solution should be given slowly by the drip method as patients in a crisis not infrequently have a rigor if it be injected more rapidly It is essential that cortical extract be given intravenously before or during the administration of the saline as without extract an intravenous saline is not maintained in the circulation and subcutaneous and intraperitoneal salines are not absorbed When the vomiting is relieved fluid should be taken in large quantities by mouth

Suprarenal Insufficiency

Acute suprarenal insufficiency is caused by acute infections, thrombosis of the suprarenal vessels and bilateral haemorrhage into the suprarenals Suprarenal haemorrhage may occur in the newborn as a result of eclampsia trauma during birth, asphyxia neonatorum, and superinvolution of the cortex in older people as the result of severe infections extensive burns syphilis, and as a manifestation of a haemorrhagic diathesis

In the newborn the clinical picture resembles pneumonia with fever dyspnoea and cyanosis but there are no pulmonary signs In older children and adults the onset is one of acute abdominal pain, vomiting diarrhoea, and fever In both groups other features are extreme asthenia and prostration, purpuric eruptions dehydration low blood pressure, convulsions, and coma In the cases of haemorrhage there are in addition the general symptoms and signs of shock, with local signs consisting of abdominal distension and a palpable swelling in one or both renal regions The condition is not easy to diagnose and is rapidly fatal Therapeutic measures consist in the treatment of shock and the administration of cortical extract and of intravenous glucose salines

Chronic suprarenal insufficiency is not well defined Patients with debility, emaciation hypotension, impotence or a low basal metabolic rate are sometimes thought to be suffering from chronic suprarenal insufficiency Some of these cases may be incomplete forms of Addison's disease others due to hypoadrenalism, but in the majority it is doubtful whether the suprarenals can be held responsible No beneficial effect is obtained with cortical extract in the absence of an adrenal lesion

[A bibliography will be given at the foot of the next article]

TEMPORARY TREATMENT IN MENTAL HOSPITAL PRACTICE

BY

W. J. BARBOUR, M.D., D.P.M.

Deputy Medical Superintendent Borough Mental Hospital Derby

The Mental Treatment Act of 1930 Section 5 permitting treatment of patients on a temporary basis has now been in operation for six years It has therefore had time to be fully investigated, and as medical officer at an institution where temporary patients constitute the largest proportion of annual admissions to any hospital in England and Wales I thought it would be of interest to survey the results and discuss the numerous difficulties

Whether the large percentage of temporary patients is a matter for approval or not is a debatable point Actually the number admitted to this hospital is much in excess of the general estimated figure according to even a liberal interpretation of the Act In a memorandum published in the Board of Control Report 1934 (Appendix p. 88), *it is pointed out that the type of patient who can* be dealt with by this section of the Act is strictly limited although it is regretted that the procedure is not being utilized in the case of rate aided patients to anything like its full possibilities

In Derby however the procedure is very much in favour due to certain definite advantages that accrue from this method and are enumerated later The proximity of the hospital to the town and the fact that the public assistance authorities—officers and doctors—are familiar with the provisions of this section are also *contributory factors to the large percentage of admissions* on a temporary basis It will be noted from Table I that the percentage has risen annually and therefore it must be a useful and desirable way of gaining admission to hospital

TABLE I—*Showing the Annual Number of Admissions during the Past Six Years by the Three Channels of Entry and also the Percentage Number of Direct Temporary Admissions*

Year	Voluntary	Temporary	Certified	Total	Percentage Direct Temporary Admissions
1931	8	29	78	115	26
1932	12	34	55	101	34
1933	15	49	57	121	42
1934	27	52	56	135	39
1935	29	82	47	158	52
1936 to Nov. 30	17	58	38	113	51

The statistics published by the Board of Control show that temporary treatment is much more frequently adopted with private than with rate aided patients and that one law for the rich and one for the poor exists to some extent though Parliament endeavoured to remedy this by the Mental Treatment Act 1930 At the present time many non-volitional cases are not receiving the benefit of the provisions to which they are entitled due largely to a tendency to adhere to the familiar and simpler procedure of certification There is no doubt that the stigma attached to certification is very strong in the public mind and that as more up to date accommodation is made available treatment by voluntary or temporary methods will be demanded by them and granted if it is at all applicable It has been estimated that only one fifth of the total number of temporary patients in England and Wales have ultimately to be certified which indicates that this procedure is serving a useful purpose

6 50 she called again at the surgery and waited about an hour without success Mrs Z suggested that she might come again on Sunday morning but she did not wish to do so, and instead called again on Monday morning at 9 o clock On this occasion the doctor made no examination, but gave her a certificate The following day (Tuesday, February 25) she called on the doctor and received a final certificate

Miss B said that on the evening of Sunday January 26 she telephoned to the doctor s surgery giving the message that her aunt had expected the doctor all day She was told that the doctor was out and possibly on his way to visit Miss G but if not he would be told when he came in

Mrs B told us she lives in the flat above her sister On the evening of Sunday January 26 the doctor called upon her sister but she herself was not present at the interview On the evening of the following Tuesday she went to the doctor s surgery with a message to the effect that Miss G s throat was not improving and that she was worried about the spots The doctor gave her a prescription for medicine and gargle and said that if Miss G was not able to come to him at the end of the week he would visit On the evening of Thursday in the following week (February 6) she went to the doctor and told him that her sister was choking The doctor visited the same evening Next morning she prepared hot water etc in the belief that the doctor was coming to lance Miss G s throat Mrs A G said she lives next door About 12 45 p m on Friday February 7 she telephoned for the doctor and was told that he was not at home, but would call as soon as he came in

PRACTITIONER S EVIDENCE

Dr Z gave evidence to the following effect On the evening of Friday January 24 he saw Miss G at his surgery and examined her Her temperature was 100° F and there was some congestion of the pharynx He advised her to go to bed and said he would call and see her on the following Sunday On Sunday evening he accordingly visited Miss G and did so without being aware that a telephone message had been sent him He chose the evening for his visit for the specific purpose of ascertaining the evening temperature which is his regular custom in all cases of mild illness with pyrexia He found the temperature normal and the throat considerably better He advised Miss G to stay in bed till Tuesday and go to see him on Thursday On the evening of Tuesday January 28 a messenger called at his surgery from Miss G and he gave prescriptions for medicine and gargle On Saturday February 1 Miss G herself called to see him at the surgery He was not prepared to speak from memory as to the extent of his examination but he certainly got the impression that the patient was practically all right and needed only a little more time for convalescence He did not know she had been in bed all the week and indeed if he had been so informed he would have taken her severely to task for coming out so soon after leaving her bed On the following Thursday (February 6) he was asked to visit the patient and he did so Her temperature was just under 101 and there was slight peritonsillar swelling He did not think there was any need for operative intervention Even in the case of large quinsies he did not believe in operative measures unless the swelling is causing distress in breathing etc and he saw no such danger then He promised to visit next day but did not promise to lance the throat nor did he promise definitely to call at 9 a m but said he would try to look in on his way to the surgery On the Friday however he was engaged at the police court all the morning and on returning home about midday he found that a telephone message had been received and he at once went to Miss G s home He found her in much the same condition as on the previous evening and still did not think it necessary to suggest lancing Miss G however insisted that lancing was necessary and as he could not agree he thought it best in all the circumstances to advise her going to hospital Regarding Miss G s visits to his surgery on Saturday February 22 when she failed to see him he had no recollection now of the reason for his absence He is of course detained occasionally by outside work as all doctors are liable to be but he has had no complaint from other patients on this score

FINDINGS OF PERSONS APPOINTED TO HEAR APPEAL

On the evidence we are unable to accept the view of the Insurance Committee that Dr Z had failed in his duty to give medical attention to Miss G It appears to us that both on Friday January 24 and Sunday January 26 Dr Z regarded Miss G s illness as very slight and that on Sunday he considered that she was better It is not suggested that he undertook to visit again Regarding Mrs B s visit to the doctor s surgery on the evening of Tuesday January 28 it is far from clear that the doctor was made to understand that Miss G was in any way worse Certainly he was not asked to visit her Further we had before us certain prescriptions issued by Dr Z and the fact that in the prescription given to Mrs B on the Tuesday the mixture that had previously been ordered for pyrexia was changed to one of a tonic nature suggests that Dr Z understood his patient to be recovering except for a degree of sore throat It is difficult to believe that a patient seriously ill would remain throughout a whole week without making any request for a visit, and would then leave her bed and go to the doctor We can only conclude that whatever misunderstanding regarding instructions there may have been between Dr Z and his patient on the evening of Sunday, January 26, there is not sufficient evidence in respect of the first week of Miss G s illness to support a contention of negligence on the doctor s part

Coming now to the following week Dr Z had seen his patient on Saturday February 1 when she herself admits that she was better in herself although her throat was still sore She apparently made no suggestion to the doctor that she was too ill to be out He heard no more from his patient until the evening of Thursday February 6 when he was asked to visit and did so and he visited again the following day when by agreement, Miss G was taken to hospital Regarding the contention that on no occasion did he visit Miss G at her home until a specific request was made, we have Dr Z s definite statement that in respect both of the visit on Sunday January 26 and of that on Friday February 7 he visited in accordance with his own previously stated intention and irrespective of the fact that messages had been sent There is nothing in the evidence to make us doubt the truth of this statement Accordingly we do not think it has been established that at any time throughout the illness Dr Z was guilty of negligence in his treatment of Miss G

We would now comment on the contention of the Insurance Committee that Dr Z had failed to make adequate arrangements for dealing with patients who called at his residence Occasions undoubtedly occur in the experience of every practitioner when he himself is prevented by outside work from getting to his surgery at his appointed hour It is of course his duty to take all reasonable steps to secure that necessary treatment is made available for his patients during his absence but we think it would be unreasonable to expect that on every occasion of delay on reaching home for surgery hours a practitioner should provide a substitute In the present instance there is no evidence to suggest that had Miss G been in need of urgent medical attention steps would not have been taken by Mrs Z to make proper arrangements As however Miss G received a final certificate on the following Tuesday it seems clear that on the Saturday she could neither have been nor looked in need of urgent medical treatment indeed it appeared to us that the sole purpose of her visits that day was to obtain a medical certificate Any inconvenience suffered by Miss G is to be regretted but we cannot find on this ground that Dr Z was guilty of neglect or committed a breach of the terms of service

siderable controversy has ranged round the words in the Act incapable of expressing himself as willing or unwilling to receive such treatment but generally speaking cases following childbirth the various types of stupor and all cases where confusion is marked have the right to receive treatment on a temporary basis The public are now well aware that such facilities exist judging from the number of inquiries and interviews with patients friends, and when any question of certification arises it is not well received as a rule

Unfortunately, though the terms voluntary and "certified are easily understood, difficulty always arises with temporary classification The relatives generally think that the latter term indicates treatment for six months only and much explanation is needed to give them a fuller knowledge of the Act

Conclusion

It will be seen that temporary treatment does confer some benefit to the patient and his friends, while certain difficulties—not insurmountable however—are added to hospital administration It is possible that by widening the scope of the section or simplifying the necessary provisions the difficulties would be much lessened and it is interesting to note that in the latest enactment (Rhodesia) temporary treatment is extended to resistive as well as non volitional cases

I have to thank Dr J Bain medical superintendent for permission to use the hospital records

RESEARCH IN BLOOD DISEASES

GRANTS AND SCHOLARSHIPS

The trustees of the Lady Tata Memorial Fund invite applications for grants and scholarships for research in diseases of the blood with special reference to leukaemia in the academic year *beginning on October 1* 1937 Grants of variable amount are made for research expenses or *to provide* scientific assistants to senior workers Scholarships are awarded as personal remuneration and they ordinarily have the value of £400 per annum for whole time research with proportionate adjustment for work on a part time basis where this is approved The grants and scholarships are *open to* workers of any nationality

Applications must be submitted before March 31 1937 and the awards will be made by the trustees in June Further particulars and forms of application may be obtained by writing to the secretary of the Scientific Advisory Committee, 138, Bedford Court Mansions London W C 1

BRITISH MEDICAL ASSOCIATION

ONE HUNDRED AND FIFTH ANNUAL MEETING, BELFAST, JULY, 1937

Patron HIS MAJESTY THE KING

President SIR E FARQUHAR BUZZARD, Bt KCVO, LLD DM FRCP Physician in Ordinary to H M the King Regius Professor of Medicine University of Oxford

President Elect R J JOHNSTONE, FRCS FCOG Professor of Gynaecology Queen's University Belfast Member of Northern Ireland Parliament

Chairman of Representative Body H S SOUTTAR CBE MD MCh FRCS

Chairman of Council SIR KAYE LE FLEMING MA MD

Treasurer N BISHOP HARMAN LLD FRCS

PROVISIONAL PROGRAMME

The Annual Representative Meeting will begin at the Assembly Hall on Friday, July 16 at 9.30 a.m., and be continued on the following three weekdays

The statutory Annual General Meeting will be held at the Assembly Hall on Tuesday, July 20, at 12.30 p.m. and the adjourned meeting at 8 p.m.

The Annual Dinner of the Association will take place at the King's Hall on Thursday July 22, at 7 p.m. The Popular Lecture will be given at the Assembly Hall on Friday July 23 at 8 p.m.

The Conference of Honorary Secretaries and the Overseas Conference will be held in the Assembly Hall on Wednesday July 21 at 2.30 p.m. and 4.30 p.m. respectively.

A Combined Religious Service will be held in Fisherwick Presbyterian Church on Tuesday July 20 at 4.30 p.m. High Mass will be celebrated 'Coram Pontifice' at St. Patrick's Church, Donegall Street, on Thursday July 22 at 9 a.m.

The Reception Room for registration at Ulster Hall will be opened at 2 p.m. on Monday July 19. Ladies Club will be at Assembly College.

The Annual Exhibition of Surgical Appliances, Foods, Drugs and Books will be held in the Ulster Hall. The official opening will take place on Tuesday July 20 at 9 a.m. It will remain open on July 21, 22 and 23 from 9 a.m. to 6 p.m.

The Pathological Museum, Physics Laboratories, Queen's University will be opened on Tuesday July 20 at 11 a.m. and will remain open on the three following days from 9 a.m.

The clinical and scientific work will be divided among *seventeen Sections meeting at the Queen's University on* Wednesday, Thursday and Friday July 21, 22 and 23. We publish below the names of the Sections and the officers appointed to each.

The following Sections will meet on Three Days

MEDICINE

President Professor W. W. D. THOMSON MD FRCP (Belfast)

Vice Presidents FOSTER COATES MD (Belfast) F. G. HOBSON DSO DM FRCP (Oxford) W. McLORINAN LRCP and SI (Belfast) Professor J. W. McNEE DSO MD FRCP (Glasgow)

Honorary Secretaries S. J. TURKINGTON MD 41 University Road Belfast EDWARD R. CULLINAN MD FRCP 10 Park Square West N.W.1

Honorary Secretaries H. P. MALCOLM MC MB MCh 27 College Gardens Belfast HAROLD C. EDWARDS MB, MS FRCS 37 Queen Anne Street W.1

Solid food was held up at the intrathoracic sphincter and afterwards proceeded slowly down the oesophagus, not under the influence of gravity but by peristalsis It passed down much more slowly than did liquid food, and when it reached the cardia passed straight through with the wave of peristaltic relaxation Semi-solid food which was too thick to flow easily and yet was still liquid behaved in the same way

Filling of the Stomach

The food, entering through the comparatively narrow cardiac orifice, first made its way into the upper passive part of the stomach, which comprised most of the fundus and was bounded below by a weak sphincter, which separated it from the more active lower part No peristaltic contraction was seen, the organ merely dilating under the normal muscular tone as more food entered it When the pressure reached a certain height the sphincter relaxed and the food fell into the second portion, moving along the greater and not the lesser curvature As soon as the second part was distended with food peristalsis was set up and the food was forced along to the third or pyloric part The contraction of the muscle during peristalsis caused a rise in pressure in the second part and the food was momentarily regurgitated into the first part The remainder was carried along to the third part, the general contraction of which forced it into the duodenum This process took place very rapidly in a stomach which had good tone In one of the films the emulsion went through the duodenum within twenty minutes of being swallowed, and could be seen passing into the jejunum while the rest of it was still entering the stomach or proceeding from the first to the second part

The normal stomach might be broadly divided into two main types—the tonic and the hypotonic The first type was vigorous in its action, was usually associated with hyperchlorhydria and lay high in the abdomen The second type was sluggish in its action, was often associated with hypochlorhydria and anaemia, and lay low in the pelvis The first part of the stomach acted only as a reservoir The second starting at the sphincter, merged into the third or pyloric part Peristaltic movement began as soon as it was distended with food and carried the food into the third part, where a general contraction took place in all directions and forced the meal through the narrow pylorus into the duodenal tract In the hypotonic stomach these three stages were not so well shown, but the passivity of the first part and the generalized contraction of the third seemed to be invariable Whether the second part underwent peristalsis was not so clear The fact that in a tonic stomach the food passed direct into the duodenum might be connected not only with the more vigorous movement but also with the acid-alkali balance between the stomach and the duodenum Possibly the change in character of the movement depended on the different arrangements of the muscular coats of the different parts of the stomach In the first there were many oblique fibres and few circular In the second the circular fibres were more numerous and it was here that peristalsis started In the third the circular coat was very thick, and some of the longitudinal fibres were interlaced with it This would allow a generalized contraction

The passage of food through the duodenum did not synchronize with the time of its escape from the stomach This might be because the circular muscle fibres of the stomach were not continuous with those of the duodenum, and only a few longitudinal fibres, which were not so concerned with peristalsis, passed between the two organs When a tonic stomach was distended with food very little mixing with the gastric juice or digestion or absorption of any kind could occur Moreover, the food was hurried so rapidly through the duodenum that it could be little mixed or digested there The films, however, showed an insoluble and unappetizing emulsion of barium and not congenial ordinary food

Reaction of the Stomach to a Meal

Both tonic and hypotonic stomachs contracted vigorously when they were suddenly distended with a large quantity of food This happened, presumably, because the muscle fibres were stretched and reacted by contracting After a short time the fibres lengthened and the organ became adapted to the bulk of food As the fibres were no longer stretched the stimulus to contraction was no longer present The second part of the hypotonic stomach became quiescent early in digestion As the food remained longer in the stomach it could be better mixed with the gastric juice In a tonic stomach food would still be rapidly passing through the duodenum twenty minutes after it had been taken This mechanism would help to account for the digestive trouble caused by taking meals hurriedly the stomach musculature having no time to adapt itself to the bulk responded by forcing the food out through the pylorus before it was sufficiently mixed with gastric juice The part of both types of stomach that remained active longest was the pyloric end, but finally it did not allow enough barium through the pylorus to cast a shadow

The relaxation of the abdominal wall allowed the coils of jejunum and ileum to come forward and settle down in the pelvis They could then no longer support the stomach and it fell, except the extreme pyloric portion, which was kept in position by its attachment to the duodenum Gastroptosis by kinking the stomach and forming a deep pool in which food might collect, could delay and prevent proper gastric digestion Moreover, the blood supply might be hindered by pressure on the vessels In the intestine the emulsion became diluted and spread out, and it was difficult to get clear pictures of the coils It moved rapidly round by peristalsis

MEINICKE'S REACTION

H Saethre and A Bretteville-Jensen (*Nord med Tidsk* August 8 1936 p 1259) report from the psychiatric department of the Ullevaal Hospital in Oslo the results of comparative studies of Meinicke's (M K R II = Meinicke's Klarungs-Reaktion II) and Wassermann's reactions carried out on 700 consecutive patients between February 1 and November 1 1935 In all the fifty-six cases in which the Wassermann was positive, M K R II was also positive There were altogether 109 cases (15 5 per cent) in which this latter reaction was positive whereas the incidence of positive Wassermanns was only 7 58 per cent In as many as forty-five of the fifty-three patients showing a positive M K R II and a negative Wassermann there was either a definite history of syphilis or some reliable sign of it In all the fifty-three cases in which the evidence of the two reactions clashed new samples of sera were submitted to a second Wassermann test which was undertaken by persons knowing that the M K R II was positive In spite of this inducement to reverse the Wassermann verdict, it was as negative as before except in two cases In one the reaction was faintly positive, in the other it was strongly so As for the eight cases in which M K R II was positive but the Wassermann and the clinical evidence were negative some may perhaps be considered as definitely non syphilitic and the frequency with which M K R II gives misleading evidence of syphilis with a non specific positive reaction may be put at between 0 5 and 1 per cent In the authors material were twenty-five patients who though they had suffered from syphilis, gave negative reactions to both tests On account of the simplicity cheapness, and comparative sensitiveness of M K R II the authors warmly recommend it, particularly for provincial hospitals and asylums not equipped for the Wassermann test Though their comparison of the two reactions is [illegible] Wassermann's, they see no likelihood of [illegible] in the near future in view of the solidity of the international basis on which it rests

PROVISIONAL TIME-TABLE

Friday July 16

9 0 a m —Annual Representative Meeting Assembly Hall
9 0 a m —Ladies Club open Assembly College
9 0 a m —Excursions for Ladies
11 0 a m —Civic Welcome to Representative Body by the Lord Mayor
1 0 p m —Lunch to Overseas Representatives
3 30 p m —Reception to Ladies accompanying Representatives by Ladies Executive Committee
7 30 p m —Representatives Dinner Grand Central Hotel
7 30 p m —Dinner to Ladies accompanying Representatives Students Union
9 30 p m —Concert

Saturday July 17

9 30 a m —Annual Representative Meeting Assembly Hall
9 30 a m —Ladies Club open Assembly College
10 30 a m —Excursions for Ladies
1 0 p m —Photograph of Representative Body
3 0 p m —Excursions for Ladies
8 30 p m —Reception to Members of the Representative Body and their Ladies by the Ulster Medical Society

Sunday July 18

9 30 a m —Representatives Excursion (all day) to Giant's Causeway
9 0 p m —Sunday Concert Whitla Medical Institute

Monday July 19

9 0 a m —Council Meeting Assembly Hall
9 30 a m —Ladies Club open Assembly College
10 0 a m —Annual Representative Meeting Assembly Hall
10 0 a m —Excursions for Ladies
2 0 p m —Reception Room open Ulster Hall
4 0 p m —Garden Party to Ladies by Mrs Leathem Mount Norris
8 45 p m —Theatre Performance

Tuesday July 20

9 0 a m —Official Opening of Exhibition Ulster Hall
9 30 a m —Annual Representative Meeting Assembly Hall
9 30 a m —Ladies Club open Assembly College
10 0 a m —Visits to Works etc
11 0 a m —Pathological Museum open Physics Laboratories Queen's University
12 30 p m —Annual General Meeting Assembly Hall
3 0 p m —Visit to Belfast Hospitals and Reception by Chairman of the Board of Management
3 0 p m —Visit to Works etc
*4 30 p m —Combined Religious Service Fisherwick Presbyterian Church
*8 0 p m —Adjourned Annual General Meeting and President's Address Assembly Hall
*9 30 p m —President's Reception Queen's University

Wednesday July 21

9 0 a m —Council Meeting Queen's University
9 0 a m —Reception Room open Ulster Hall
9 0 a m —Exhibition open, Ulster Hall
9 0 a m —Pathological Museum open Physics Laboratories Queen's University
9 30 a m —Ladies Club open Assembly College
10 0 a m —Scientific Sections Queen's University
10 0 a m —Notts Ladies Golf Cup Competition Royal Belfast Golf Club
10 0 a m —Visits to Works etc
10 30 a m —Short Tours
1 0 p m —Irish Medical Schools and Graduates Association Lunch
2 30 p m —Secretaries Conference Assembly Hall
2 30 p m —Demonstrations at City Hospitals
2 30 p m —Visits to Works
4 30 p m —Overseas Conference Assembly Hall
*4 30 p m —University Reception at Lennoxvale
7 0 p m —Secretaries Dinner
*8 30 p m —Civic Reception City Hall
8 30 p m —Dance on R M S *Almenora*

Thursday July 22

8 0 a m —Annual Medical Breakfast of National Temperance League
9 0 a m —High Mass Coram Populo St Peter Church Donegall Street
9 0 a m —Reception Room open Ulster Hall
9 0 a m —Exhibition open Ulster Hall
9 0 a m —Pathological Museum open Physics Laboratories Queen's University
9 30 a m —Ladies Club open Assembly College
10 0 a m —Scientific Sections Queen's University
10 0 a m —Golf Competition for Ladies and Gentlemen's Cups Malone Golf Club
10 0 a m —Visits to Works etc
11 0 a m —Reception by Countess of Clanwilliam at Montalto
10 30 a m —Short Tours
1 0 p m —Lunch to Women Members of Medical Profession Whitla Medical Institute
2 30 p m —Demonstrations at Hospital
2 30 p m —Visits to Works
*3 0 p m —Conferment of Honorary Degree
*4 30 p m —Garden Party and Reception by Government of Northern Ireland at Stormont
7 0 p m —Annual Dinner and Dance at King's Hall

Friday July 23

8 30 p m —Missionary Breakfast of Medical Prayer Union
9 0 a m —Reception Room open Ulster Hall
9 0 a m —Exhibition open Ulster Hall
9 0 a m —Pathological Museum open Physics Laboratories Queen's University
9 30 a m —Ladies Club open Assembly College
9 30 a m —All day Excursion to Giant's Causeway and Antrim Coast Road
10 0 a m —Scientific Sections Queen's University
10 0 a m —Visits to Works etc
2 0 p m —Treasurer's Cup Golf Competition at Belvoir Golf Club
2 30 p m —Garden Parties
2 30 p m —Visits to Works
8 0 p m —Popular Lecture Assembly Hall
9 0 p m —Branch and Division Reception at Floral Hall Hazlewood and Zoological Gardens

Saturday July 24

10 0 a m —Excursion to Silent Valley and Mourne Mountains

* Academic dress will be worn at these functions

All bedrooms will probably have telephones.
† Allocation of rooms not stated but will probably be 10 per cent.

philosophical appraisement of the experimental method itself, an insufficient attempt to bring home to the student the essential unities of physiology and pathology Experiments were staged, tools were set, and the result was expected even if not always achieved but there was no real effort to encourage the experimental or observational attitude of mind

Among students there were various types There was the naturalist type, the inquisitive, observing boy, who might survive this kind of education, but he was a rare type on the whole, and the majority were unobservant, any observing power which they had had as small children having been eliminated by the set teaching of the schools Another type who succeeded he could best picture as a Scotsman, a man of common sense, who, however much or little of science he had picked up, understood the lights and shades of a clinical problem, and had good judgement, logic, and humanity in handling his patient He, too, in spite of his education, would be a success but he was *not the commonest type in the medical school* A third type was the distinguished student, first-class in his pre clinical work, but often quite a failure in the ward, slow in the development of clinical sense clumsy or irrational in his therapeutic suggestions, having looked too long through microscopes or relied too much on calorimetric standards or chemical reactions, and finding it difficult to believe that conclusions could be drawn by the crude methods, as he thought them, of clinical assay He had difficulty in accepting anything not measurable by millimetres, with the result that a discontent with clinical medicine was engendered But these types did not make up the majority and the average student muddled through his pre-clinical course entered the wards and there gradually obtained a reorientation of his mind and acquired the clinical knack

The Study of Human Biology

Laboratory education started so early and continued so long (said Professor Ryle) that it postponed observational discipline It tended to create an unduly specialistic mind in the laboratory-minded *student, with boredom or* bewilderment in face of clinical problems He had dipped recently into the *Collected Papers of Hughlings Jackson* and found him insisting in one of his lectures that every case presented was a fact or an experiment of nature and the experiments could be carried backwards to their beginning or forwards to their conclusion Whatever branch of medicine ultimately claimed the student he was a student of human biology The biology of man in health and disease in every aspect was the student's subject and it was the business of the teacher by every means to stimulate his interest in it He thought all were agreed that far too heavy a demand was made on the student in the matter of memorizing anatomy and there was probably too great a local or personal bias in the teaching of physiology

As for the suggestion that there should be a double curriculum to meet the needs of the practitioner on the one hand and the medical scientist on the other, the question was whether the present curriculum included less than the practitioner required or less than the scientist required In the courses for the Oxford Cambridge and London degrees he believed the provision was adequate for the scientist but the bulk of the subjects in the framework could be reduced Why not greater choice of subjects some selection of subjects within the general framework of physiology and anatomy which would, of course necessitate more frequent alternative questions at examination? But how did a man know what his destiny would be until he had been through the wards for a year or two? That was the strongest argument against a double curriculum He could not feel that the time had come for such dichotomy No specialization in any branch of human biology *should be permitted* without a full pre-clinical and clinical graduate training Finally the speaker stressed the need for more intimate co operation between the pre-clinical and clinical teachers

The Grammar of Scientific Method

Professor G. GREY TURNER emphasized the importance of teaching the principles of the experimental method from the earliest period of the student's career What was so necessary was the inculcation of the grammar of the scientific method, not so much what was to be learned from the application of such methods as the application of them, so that when at a later stage, the medical student came into contact with actual clinical problems he would know better how to approach them From the earliest stage the student ought to be made to understand that research was not necessarily the finding out of something new, but the finding out of something for himself He had supposed that in that discussion a good deal would be heard about the importance of animal experiment Valuable as that method was, and more important as it was becoming, it must be remembered that a great many of the advances in medicine (using the word in its widest sense) had come from observations made on human beings He deprecated the tendency to educate the medical student in watertight compartments It was the co ordination of subjects that was so extremely important He felt strongly that the experimental method should become more ordinary in medicine, more a routine and everyday event, and then when something had to be settled in connexion with a natural problem in the management of disease the problem could be solved there and then by appealing to the laboratory He used to think there were types of students, as Professor Ryle suggested, more suited to one thing than to another, but he believed now that the supposed differences were largely a response to environment and could be modified

Dr R A YOUNG said that medical education was really only one aspect of general education, which was rather in the melting pot at the present time He had always wondered why a child who asked questions began with 'Why," whereas a student began with "What,' and after he had been taught a few things asked "How ' What he had tried to do in teaching was to inculcate not a sceptical but an inquiring attitude of mind A student *should be told that because he was taught a certain thing* and because it had a certain authority behind it, it was not necessarily true All great advances had been made by questioning what had previously been accepted It would be a *good thing for medicine* if "Research" with the capital R' could be deleted from the vocabulary and replaced by "investigation" Every doctor who investigated a difficult case was doing valuable research Medicine as a science was a branch of biology and therefore all biological science was of interest and value to the student of medicine Science could ascend to the transcendental, but it had in its relation to humanity to be applied, and medicine in practice was an applied science and therefore an art He endorsed the importance of taking the student to the bedside as soon as possible There he would realize the value of the methods he had learned in the laboratory Another thing from which they suffered at the present time was over-specialization It could not be helped, the public demanded it, but it was desirable to have a certain number of people in the teaching schools who were capable of a general conspectus of the whole curriculum and of teaching the student the relative value of the different specialties

A False Antithesis

Dr C M WILSON said that at the medical schools an endeavour was made to turn out men with a *certain* habit of thought which was called the scientific mind If they could all agree on that it would not be difficult to make out a case for the laboratory, but a false antithesis had grown up between the clinician and the man of science A man of science was not one who used certain instruments in certain places, it was not the instrument (which merely sharpened observation) *but the man's* mental processes that made him the scientist Such a man was committed by the way he was made and by his training to a critical scrutiny of facts He was cautious

R A M C, I saw the British Military Hospital at the Cantonment situated a few miles outside Delhi, thus seeing another aspect of medical life in India

Peshawar and Lahore

We left Delhi on Saturday, December 19 for Rawalpindi where we were met by Lieut Colonel Puri I M S civil surgeon who had arranged a tea party so that I might have an opportunity of meeting a number of medical men in Governmental service chief of whom was Colonel W H Hamilton I M S the D D M S of the Northern Command The same evening I addressed the medical practitioners of Rawalpindi and as this was followed by a discussion I had a most interesting and instructive evening We entrained again at 11 15 the same night and reached Peshawar at 6 a m next (a very cold and frosty) morning Our stay in Peshawar was short—barely two days—but during that time I established contact with all branches of medical work there I visited the Indian Military Hospital and met many of the R A M C and I M S an unusual number of whom were present in the district because of frontier trouble Brevet Colonel H Hay Thorburn I M S Inspector General of Civil Hospitals had been good enough to arrange a meeting of the practitioners of Peshawar at which I explained the purpose of my visit There was a most useful discussion after this meeting and finally a decision was taken to form in the future a North West Frontier Branch of the B M A The civil surgeon Major Ledger I M S motored us up to the Khyber Pass and from the top we looked into Afghanistan

Our visit to Peshawar ended on Tuesday evening at 6 p m and we arrived at Lahore at 8 a m the following morning where we were met by Dr J Cairns president of the Punjab Branch and Dr N R Dharmarvir the honorary secretary We spent the next six days in Lahore except for a brief visit to Amritsar which is about one hour's journey by rail My time was very fully occupied and every opportunity was afforded me of discussing medical affairs with representatives of all classes of practitioners Dr Gopal Singh Chawla an independent medical practitioner, Dr Dharmarvir and Dr Cairns kept me busy I addressed the members of the profession and a discussion followed I visited hospitals public and private, and I interviewed practitioners at their rooms and in Dr Cairns's house where my wife and I were guests during our stay in Lahore Dr Cairns is chief medical officer of a large district and consequently I was able to learn a good deal about the service for which he is responsible Notwithstanding the fact that I was in Lahore during Christmas my time there was fully occupied The evening before we left Lieut Colonel P B Barucha I M S principal King Edward Medical College arranged a dinner in our honour in the College Hall A member of the Association in Amritsar Dr Sohan Singh was my guide in that town where I visited the Medical School, the Golden Temple and other places of interest Here again I met a number of the local profession and learnt more of their difficulties On the way to Agra I visited Ludhiana and through the courtesy of Dame Edith Brown was shown over the Women's Christian Medical College and Hospital where women medical students are trained

Conference of Licentiates at Agra

On arrival at Agra on Wednesday December 30 we were met at the station by Dr T S Shukla and Dr D D Bhargava, who conveyed an invitation for me to attend the opening session of the All India Licentiates Medical Association which was being held that day in the Medical School at Agra I was privileged to listen to an address given by Dr S L Sharma the chairman of the Reception Committee of the twenty eighth conference Thus at first hand I was able to ascertain what I believe to be the collective view of the medical profession in India After the meeting I had the good fortune to meet some of the practitioners of Agra and learned in greater detail about many of the problems to which reference had been made in Dr Sharma's speech Later in the evening there was a full moon my wife and I visited Taj Mahal having been advised that this was the ideal time at which to see it To other places of historic importance we were able to pay only a fleeting visit

The following day we entrained again our next stopping place being Nagpur which we reached on January 1 Major R F W K Allen the civil surgeon in Nagpur was my guide in that city and he arranged a meeting of the medical profession in order that I might hear their point of view I had various discussions with the representatives present and altogether spent a most useful time in the only place in the Central Provinces which I was to have an opportunity of visiting I saw the hospital and medical school there and talked with a number of medical men On Monday January 3 we arrived at Hyderabad where I was met on the station platform by Dr C F Chenoy the president of the Branch Dr K V Nayak the honorary secretary and Lieut Colonel R F D MacGregor the residency surgeon and other members of the Branch Council Conditions are not quite the same in Hyderabad which is a State as in other places I had visited but I spent a most instructive pleasant and busy six days in learning about the problems which confront the medical profession and community here and also in Secunderabad I visited the following hospitals the British Military under the command of Lieut Colonel H L Howell R A M C (and in going round was happy to meet Captain W M Oxley R A M C the son of that good friend to the Association Dr W H F Oxley of Poplar) the Indian Military Hospital under the command of Lieut Colonel E A Penny I M S the King Edward Memorial Hospital under the care of Lieut Colonel R F D MacGregor the Osmania Hospital in charge of Colonel J Norman Walker I M S (ret) director of public health services in Hyderabad In this way I met the majority of medical men on the staffs of the various hospitals and saw the conditions under which they worked I had personal interviews with Government officers in the State service and with independent medical practitioners and I think I may safely say that my time was most usefully spent in that city I received great kindness from everyone not only from members of the medical profession but also from the Government itself through the Finance Minister Sir Akbar Hydari I was shown the great improvements which had been effected in the housing conditions in that city and was fortunate in being shown these by the prime mover Sir Nizamat Jung During the time we were in Hyderabad the Indian Science Congress was in session and I was privileged to attend a few of the functions We left Hyderabad on Sunday the 10th and arrived in Madras on the evening of the following day

There is very little time for sightseeing as there are social functions to be attended such as luncheons dinners and garden parties where I can meet medical men and discuss their problems Visitors to India are overwhelmed with invitations of all kinds My wife tells me she is learning something every day She has been taken to hospitals Zenana hospitals schools welfare centres

ability Patients with the tetralogy of Fallot sometimes lived long, one of his patients was now 49, but lived a restricted life, while another had survived an attack of lobar pneumonia and was now getting married at the age of 33 Two others had died of pulmonary tuberculosis as young adults There was no doubt that any cyanotic case must lead a very restricted life, which was not likely to be long, though the long-lived exceptions offered grounds for hope The period of active growth at puberty was naturally a critical time and a lesion that might be tolerated in the body of a child might well be impossible for the adult

Of the acyanotic lesions patency of the interventricular septum seemed to be the commonest In one of his cases the murmur had disappeared at about the age of 4, and it might be presumed that the hole had closed or the flow of blood through it had ceased He imagined that the smallest hole made the most noise and that probably a very large hole made no murmur He had noted a small series of fifteen cases, all in females, with a systolic murmur in the pulmonary area, usually, but not always, accompanied by a thrill The pulmonary second sound was loud and the closure of the valves palpable Examination with x rays showed that the pulmonary artery was enlarged, there were no other abnormalities The ages ranged from 7 to 52, and seven were over 35 Their lives were not affected, so the lesion could not be important, and there was no need to restrict them In children the murmur was said to be confined to systole, but he doubted whether this was so in adults

Valvular Lesions

Bicuspid aortic valves were of no importance in themselves but their liability to infection made them significant later on In the more advanced years of life cases of aortic stenosis with fused calcareous aortic valves were found, and Dr East wondered whether some of these started as congenital abnormalities When the stenosis developed there was of course, a strain on the left ventricle and the patient must be protected from overexertion Coarctation seemed to be as well tolerated as any congenital defect One day the patient would probably die as the result of it and therefore some limitation of activity seemed to be indicated, in adults at any rate, especially as years went on and other defects were likely to appear As all patients with congenital lesions of the heart were liable to infections, it seemed wise to try to control septic foci Unfortunately the infection crept in insidiously, possibly starting as an apparently trivial bout of influenza Special care was needed for these patients in any mild febrile attack The question of pregnancy might sometimes arise There did not seem to be any contraindication in patent ductus A patient with a patent septum would probably be safe, provided there was no enlargement of the heart If there were, some risk of a right-left shunt in the later stages might be encountered He imagined that a cyanotic case should not run the risk of pregnancy

Persons with congenital heart lesions were occasionally proposed for life assurance An acyanotic case, patent septum or patent ductus, might be accepted if the lesion were perfectly tolerated A heavy load should be imposed to cover the risk of infection and acceptance only recommended for a limited term of years, not exceeding say, forty The acyanotic lesions were evidently well borne in youth but so were acquired lesions very often In the adult body the defect was apt to cause more trouble In any large group of children with heart lesions the congenital variety turned up fairly often In adults one got the impression that they were seen far less frequently and by the age of 40 they were rare In his view special care was needed in any case of congenital heart disease to protect the patient from infection As regards activity, acyanotic cases could usually do a good deal but should be guarded from the extreme forms of exertion

Observations on School Children

Dr C MUIR mentioned observations on school children, including some below and some above school age In the very young—that is, pre school age—it was extremely difficult, if not impossible, to make out any anatomical defect or even to say whether an infant who was quite non cyanotic might not later pass into a definite cyanotic condition He and his colleagues thought they had been able to confirm the disappearance of physical signs on two occasions In one case a systolic thrill and bruit which had been observed over a period of seven years had gradually disappeared entirely Infective endocarditis seemed to be more common with patent ductus than in Roger's disease The activity of one case of patent ductus was greatly restricted by severe pain, characteristically anginal in production and distribution The absence of symptoms in the presence of well-marked signs was a feature of cases of subaortic stenosis In his series of children there had been four deaths, one of these was from pulmonary tuberculosis and two from infective endocarditis, the fourth death took place suddenly during cycling

Dr J W BROWN said that in a total group of 291 congenital heart cases there were fifty-seven (19 per cent) with cyanosis He felt that not all the cases in this group were seen at the clinic, for a certain number were kept permanently from school or were inmates of other institutions His impression was that the cyanotic child was at least equal in intelligence to his normal fellow, and it was a great mistake to place the children in special schools with the mentally defective and backward The children should be encouraged to go to ordinary schools, even if only part-time Clinical experience suggested a revision of ideas of prognosis in this group The cases might survive much longer than was generally supposed, and the degree of cyanosis presented remained strikingly constant The infectious diseases of childhood such as measles and whooping cough, figured largely in the history of these children, and scarlet fever appeared to be a specially dangerous complication Tuberculosis had also occurred in several members of the group Examination had always included regular weighing and measuring, and only a small percentage were below the average height and weight Pregnancy had occurred in one member of the group—a woman with the tetralogy of Fallot Labour was induced She had had two pregnancies since and suffered no harm Supervision of an effective and friendly nature was the most desirable factor in the management of these cases He thought the work of the clinics had done something to dispel the air of fatality which surrounded this group, and many of the child patients had been much happier since they had been allowed to take some part, small though it might be, in school activities

Dr EVAN BEDFORD said the question might be raised as to what it was from which the majority of these patients died It was extremely rare to see congestive failure in congenital heart disease In his experience the patients died either from intercurrent disease or added infective endocarditis, or sometimes from coarctation or rupture In one group of cases, those with patent interauricular septum the patients had no symptoms at birth and were scarcely ever diagnosed as having heart trouble until they reached puberty The radiological picture was rather characteristic It was one of the few congenital lesions in which the heart reached very large dimensions In the tetralogy of Fallot one rarely saw a heart wider than the normal Auricular fibrillation was not common, and these patients died frequently of congestive heart failure Dr GIBSON raised the question whether boys in the acyanotic group should be allowed to take part in competitive athletics Dr LEONARD FINDLAY spoke of the difficulty of recognizing congenital heart disease Numbers of children had a basal systolic murmur which disappeared as they got older, he looked upon these cases as functional

incapable of work as she was suffering from haemorrhoids and constipation and general debility following her confinement Dr W examined her and gave her a certificate Unfortunately he had referred to her record card and evidently had this in mind when he wrote the word pregnancy in the certificate He (Dr E) could offer no excuse except that he was away at the time and Dr W was consequently very busy Obviously the society's sick visitor would know that it was a mistake and if the society had drawn his or Dr W's attention to the mistake it would have been rectified The secretary of the society attended before the subcommittee and said the sick visitor reported the matter on August 21 and that the certificate complained of was the first certificate received after the confinement

As the principal is responsible for the acts and omissions of his assistant the Medical Service Subcommittee found it was unable to do other than recommend that the respondent practitioner should be censured and warned against any future similar breach of his Terms of Service

Absence from Practice

An Insurance Committee was informed on October 12 1936 by the assistant in a practice that his principal had been absent from practice about four weeks that he had an operation on October 6 and that it would be approximately a further three weeks before he could resume practice The assistant stated that he was carrying on the practice A communication was sent to the principal that as his list was beyond the limit allowed to a practitioner carrying on practice single handed he should engage a locumtenent at once No reply was received from him and the matter was referred to the Panel Committee

The secretary of the Panel Committee reported that his committee had considered this matter, and was of opinion that the practitioner should be informed at once that he should engage a locumtenent or assistant during his absence and that failing such an appointment within a very short time he should be notified that his list must be reduced It was not necessary in this case to take any further action as the doctor had engaged a locumtenent and had since resumed practice The case is worth noting because a practitioner does not always realize that in such circumstances if he (or the assistant) is absent a locumtenent must be appointed Committees of course do not expect this requirement to be unreasonably observed—in London for instance cases arising during the holiday period from May to September are exempted

Medical Services in Connexion with Teeth Extraction

A report of a decision of the Minister on appeal recently appeared in these notes under the heading A Decision which Decides Nothing It may be remembered that a doctor was called up late at night to arrest haemorrhage of the gums following extraction of teeth the dentist not being available The appeal was allowed on a technical point of procedure the Minister indicating that no decision was in fact being given on the actual question which was raised as to whether the service fell within the practitioner's insurance contract In a report of the case presented to the London Insurance Committee on January 28 the representations which were made in the course of the appeal are set out at length The following extracts from the representations made by the practitioner are reproduced as giving some indication of his grounds of appeal

In the report of the Medical Service Subcommittee as adopted by the London Insurance Committee the committee states that its function is to administer the Terms of Service as they are and not as they are thought to be or as the practitioner would wish them to be It is on this assumption that the committee as stated in the report took the step to find against me It is the object of [illegible] out definitely what the Terms of Service are in dental work and to remove an ambiguity [illegible] existed for over twenty years Finally [illegible] failed to take note of the practical [illegible] apparently involved cases should be dealt with in a way to the now well established routine adopted [illegible] cases occurring on other doctors lists [illegible] unanimous desire amongst the body of insurance practitioners for an equitable solution of these difficulties would thus desire to see the Terms of Service [illegible] more clearly laid down

The Insurance Committee has decided that [illegible] shall now be referred under the formal procedure to the Local Medical Committee

Appeal Against Decision of London Insurance Committee

The following is a copy of the report made to the Minister of Health by persons appointed to hear the appeal of Dr Z against a decision of the London Insurance Committee that in respect of the attendance and treatment given by him to Miss G an insured person on his list there was a breach of the terms of service of insurance practitioners

Mr Gilbert clerk to the Insurance Committee presented the case on the committee's behalf and Dr Z was represented by counsel (Mr Murphy instructed by Messrs Le Brasseur and Oakley) On behalf of the Insurance Committee evidence was given by Miss G herself Miss B (niece) Mrs B (sister) and Mrs A G (sister in law) For the appellant Dr Z himself was the sole witness

EVIDENCE FOR THE INSURANCE COMMITTEE

Miss G told us that on Friday January 24 1936 while at work she began to suffer from sore throat She saw the works nurse who advised her to see her doctor She accordingly left work and went home about midday and in the evening visited the doctor at his surgery He examined her throat told her to go to bed and said he would visit her on the following Sunday On Sunday her throat was worse and as the doctor had not yet called she between 5 and 6 p.m. sent her niece to telephone for him The doctor called at 9 o'clock took her temperature and examined her throat He said that there were three nasty spots and told her to keep to her bed for a week and then report to him Thereafter her throat continued to get worse and on the evening of Tuesday January 28 she told her sister to call upon the doctor and tell him she was no better Her sister brought back a mixture and a gargle By Thursday January 30 although the throat was still bad she was a bit better in her ch On the following day (Friday) she got out of bed about midday in preparation for a visit to the doctor on the Saturday On Saturday morning (February 1) she visited the doctor and told him her throat was still bad He did not examine her throat but gave her medicine and a certificate The same evening she went back to bed as she did not feel so well The following day (Sunday) she was unable to take any breakfast as she could not swallow and she kept to bed where she remained till the following Thursday (February 6) On that day her throat was so painful that she could not swallow even milk or water and in the evening she sent to the doctor who came at 7.30 and told her that there was an abscess but that it was not yet ready to lance and he would come and lance it at 9 o'clock next morning Next day (Friday) as the doctor had not arrived by 12.45 p.m. she asked her sister in law to telephone him and he came at 1.45 He suggested that he should go to [illegible] to the M[illegible] Hospital but she preferred to go to [illegible] H[illegible] Hospital and the doctor [illegible] She went to the hospital where he was given [illegible] and the abscess burst the same night She remained [illegible] till the following Thursday February [illegible] was advised to see her doctor in a few days A however she already had a hospital certificate to give to her approved society she did not think it necessary to visit Dr Z until Saturday of the following week (February 22) She arrived at the surgery about 12.30 p.m. and waited till 2.15 without seeing the doctor Neither Mrs Z nor the maid could say when the doctor would return The same evening about

the puerperium and the well known likelihood of a recurrence of this condition She was admitted to hospital for treatment, but was fairly well except for occasional headache, slight rise in blood pressure (150/80), and a little oedema She received treatment with urinary antiseptics, and was kept on a low protein diet, but the albuminuria and pyuria persisted to some extent until the onset of labour On March 14, 1936, labour commenced, after twelve hours the cervix was three fingers dilated and drawn up, and the membranes had ruptured the presenting head lying above a very obvious cystic swelling The patient's temperature then suddenly rose to 100 6° F and her pulse rate became rapid (118) Dr A A Gemmell saw the patient at this time and agreed that Caesarean section must be performed A lower segment operation was performed under spinal anaesthesia However, instead of opening the uterus before exploring the pelvis, as on the first occasion, a hand was passed down to the left of the head and a very obvious retroperitoneal tumour was discovered, about the size of a Jaffa orange A living male child (6 lb 2 oz) was delivered by the usual technique, and, having sutured the uterus, the operator proceeded to investigate the tumour more fully To his surprise, once again it had disappeared However, on very careful palpation an indefinite soft mass partly fluctuant, was discovered running down beside the pelvic colon He realized the risk of haemorrhage in attempting to deal with pelvic tumours at the time of Caesarean section, but in view of the temperature decided that in this case a further exploration was necessary There was no true broad ligament on the left side, but the peritoneum was incised and dissection was made by finger only The tumour was easily separated from its connexions, but it burst just before its removal and very offensive yellowish fluid escaped Care was taken to avoid clamping or cutting, since it was obvious the ureter must be very close At one stage a strand of tissue appeared and, in view of the possibility of its being the ureter it was examined closely between two fingers during this process it broke, and the surgeon became quite certain that it could not be the ureter, which is usually resistant At no time was a single vessel of any size seen nor was any bleeding point tied The tumour having been removed there was now a cavity extending retro-peritoneally down to within two inches of the perineum This repeatedly filled with blood which oozed from all sides No attempt to find bleeding points was made, but the cavity was at once packed with ten yards of 12 inch gauze The abdomen was closed with tube drainage and the patient left the theatre in good condition Convalescence was a little stormy, and the patient suffered some distension The chief difficulty was the removal of the gauze which had two knots in its con-tinuity It was gradually removed in the course of forty-eight hours gas and air analgesia being used for the removal of each portion The wound broke down partly, but the lochia remained inoffensive The temperature was never higher than 101 5° F and by the eighteenth day the wound was practically healed the temperature and pulse normal, and the patient feeling well She was discharged from hospital on the fortieth day

Before opening the tumour it was fixed in formalin It was examined carefully forty-eight hours after opera-tion and was surprisingly found to be a kidney All renal tissue had been destroyed and it had been converted into a pyonephrosis, but its shape and histological appear-ance made the diagnosis certain The strand of tissue which broke was in reality, an atrophied ureter In view of the diagnosis a self-retaining catheter was kept in the bladder for one week, but there was never any discharge of urine from the abdominal wound The solution of the mystery was now clear This true pelvic kidney was sufficiently small to allow spontaneous par-turition until it became hydronephrotic At the time of the first Caesarean section the hydronephrosis collapsed during the delivery of the foetal head, and the cyst therefore seemed to disappear By the time of the second Caesarean section a pyonephrosis had formed, even then it had partly collapsed during delivery of the head and but for the fact that the tumour had been investigated before incision of the uterus it might have escaped notice a second time

Professor H BRIGGS (Liverpool) thought that an inter esting feature of the case was the association of pelvic kidney and unicornuate uterus, the pelvic kidney being on the side of the missing horn Professor MILES PHILLIPS (Sheffield) had encountered two similar cases In one the hydronephrotic kidney had been pushed up, and labour had been completed by natural forces The other had been treated by Caesarean section

CONGENITAL CYSTIC DISEASE OF THE LUNG

At a meeting of the Liverpool Medical Institution on January 21, with the president, Mr G C E SIMPSON in the chair Dr A ADAMS read a paper on congenital cystic disease of the lungs

Dr Adams said that before 1935 few cases had been reported, but since then a considerable number There was no evidence of increased incidence, and it was more probable that improved radiological technique and inter pretation and greater interest in chest surgery had led to the recognition of more cases Two patients had recently been admitted to the Liverpool Sanatorium and diagnosed as suffering from congenital cystic disease of the lung One was a boy of 6 on whom a lobectomy was performed by Mr John T Morrison with satisfactory results Radiographs showing the condition of the lung at the ages of 3½ 5 and again at 6 years (immediately before operation) were compared, and attention was drawn to the absence of progressive changes such as would be expected in infective conditions, the gross specimen, with photographs and photomicrographs, was also demon strated The other patient, a man of 38, had a collapsed right lower lobe—or, more probably, accessory right lower lobe—which showed well a multiple cystic condition occu pying the whole lobe, the other lobes were normal After a brief survey of the subject Dr Adams concluded that the condition would be better called "telangiectatic bronchiectasis", that it was more common than the literature suggested, that it was due to intra uterine mal formation or infection, or to early extra-uterine infection, that the gross macroscopic changes were greatly in excess of those suggested by the radiographs, that progress was slow and radiographs taken over long periods revealed little advance, that symptoms, where not caused by mechanical interference were due to secondary infections of the cysts, and that surgery offered the best prospect of cure

Mr F RONALD EDWARDS said that one must go further back than the extra-uterine infection theory in considering the aetiology of congenital cystic disease of the lung The most simple explanation was that it was a purely congenital condition due to lack of complete haustration of certain bronchi or bronchioles One could compare it with the haustration which occurred during the develop ment of other organs—for example, the oesophagus—where the development might be incomplete, resulting in complete lack of opening or, as one saw on occasion, cyst formation in the area that should have become the organ If these cysts were isolated then the condition was one of congenital cystic disease of the lungs, if the cysts communicated with bronchi, as they might if a further stage of development was presupposed, the con dition was one of congenital bronchiectasis A further interesting clinical type was the non-tuberculous pul monary abscess which did not clear up on drainage Section of the wall usually disclosed columnar or cubical epithelial cells and these cases were usually ones of unsuspected congenital cysts of the lung in which suppura tion had brought their presence to light

The Harris Operation for Prostatectomy

A film by Mr CHARLES WELLS illustrating Harris's technique of prostatectomy with immediate closure of the bladder was shown and a short paper by him was read by the PRESIDENT Mr Wells being absent through illness

Squadron Leaders L I Hyder to R A F Station Heliopolis Egypt for duty as Medical Officer F L White to Headquarters Bomber Command Uxbridge for duty as Medical Officer

Flight Lieutenants D A Wilson to R A F Hospital Cranwell E Donovan to R A F Station Hemswell

Flying Officers E W R Farley to No 4 Armament Training Camp, Wet Freugh R H Pritt to R A F Station Odiham E J Moynahan to R A F Station Tangmere

AUXILIARY AIR FORCE RESERVE OF OFFICERS MEDICAL BRANCH

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Lieut Colonel E L Sandiland T D has vacated the appointment of Officer Commanding 170th (Cavalry) Field Ambulance on completion of tenure and has been promoted to Brevet Colonel

Major D Stewart T D to be Lieutenant Colonel and to command 170th (Cavalry) Field Ambulance

Lieutenant H Weir to be Captain with seniority July 2 1936

To be Lieutenants J McG Rogan late Cadet Lance Corporal Royal High School Contingent Junior Division O T C J C Lindsay

TERRITORIAL ARMY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

Captain J B Fulton from active list to be Captain

TESTIMONIAL TO DR GUY DAIN

The objects of the Fund are to honour Dr Dain for his valuable services to the medical profession during the past twenty years and to give effect to Dr Dain's wish that the amount subscribed shall be utilized for the purpose of assisting the education of sons and daughters of medical practitioners who are in need of such help

TABLE OF OFFICIAL DATES

March 20 Sat — Nomination Papers available (on application at Head Office) for election of (i) 22 Members of Council by Grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 2 representatives of Public Health Service in Representative Body

April 7 Wed — Council

April 24 Sat — *Publication of Annual Report of Council in B M J Supplement*

Last day for receipt at Head Office of Nominations (i) by a Division of not less than Members for election of 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) for election of 2 Public Health Service Members of Council and 2 representatives of Public Health Service in Representative Body

May 8 Sat — Publication in *B M J Supplement* of list of Nominations for Election of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 2 representatives of Public Health Service in Representative Body

Voting Papers posed from Head Office where there are contest in above elections

Application for B M A Research Scholarships and Grants must be received at Head Office by this date

May 10 Mon — Motions by Divisions and Branches for A R M Agenda on matters of which two months notice must be given must be received at Head Office by this date

May 15 Sat — Publication in *B M J Supplement* of Motions and Amendments by Divisions and Branches for A R M on matter of which two months notice must be given

Representatives and Deputy Representatives must be elected by this date

Last day for receipt at Head Office of Voting Paper for election where there are contests of (i) 22 Members of Council by grouped Branches in Great Britain and Northern Ireland (ii) 2 Public Health Service Members of Council and 2 representatives of Public Health Service in Representative Body

May 29 Sat — Publication in *B M J Supplement* of result of election of Members of Council and representatives of above elections

Nomination Papers available (on application at Head Office) for election of 11 Members of Council by grouped Representatives

June 2 Wed — Council

INTRACAPSULAR FRACTURES OF FEMUR

At a meeting of the Ulster Medical Society at the Whitla Medical Institute, Belfast, on January 14 Mr S T IRWIN, with the aid of a series of fifty lantern slides, sketched the development of the modern operative treatment of fracture of the neck of the femur He began by indicating that of the three types of this fracture that in the middle of the neck was the one most suitable for operative treatment The subcapital fracture and the fracture at the base of the neck were frequently followed by spontaneous cure, and in any case the subcapital one was not suitable for operative treatment because of the shortness of the proximal fragment The old idea that fractures of the neck in contrast with fractures of the great trochanter, only occurred in old age was shown to be false In Smith-Petersen's original list of twenty-four fractures fifteen occurred in patients under the age of 60, an age incidence also recorded by Noordenbos from Holland

Ever since the introduction of modern surgery tentative methods had been suggested for dealing with a fracture in which failure of union occurred in approximately 50 per cent of cases dealt with conservatively Many of these methods failed because the conditions necessary for success were absent For success the following conditions, applicable to fractures in general, should be fulfilled (1) complete reduction of the fracture, (2) accurate apposition of the fragments, and (3) maintenance of apposition until bone formation had become firmly established Nails, wires, screws, ivory and ox-bone pegs and autogenous bone grafts were the materials used It was only when the triradiate nail was discovered by Smith-Petersen that all the foregoing essentials became relatively easily attained Its advantages were that it held the fragments firmly together prevented rotation and, when made of stainless steel it did not lead to necrosis of bony substance, upon which union subsequently depended Noordenbos of Amsterdam was the only prominent authority on this subject who still used fibular grafts in preference to the Smith-Petersen nail Since 1931, when Smith-Petersen's original paper was published, the use of the nail had been almost universal, modifications centring round the technique of its introduction The main object in its variation had been to introduce the nail without the necessity for the relatively big operation suggested by Smith Petersen and in this way to widen the age limits to include the older patients The use of a guide wire of the Kirschner gauge was suggested simultaneously in 1932 by Johanssen of Oslo and King of Melbourne Both these operators by using x ray films introduced one or several wires to determine beforehand the correct alignment of the nail, they then with a special hollow nail following the course of the guide wire drove the nail into position and impacted the fragments Reports of the occurrence of accidental bending of the wires and other complications led to the adoption of wires of a heavier calibre This alteration was first suggested by Watson Jones, who however reverted to an open type of operation Recently Hey Groves had devised an ingenious instrument for introducing the guide This did away with the necessity for an x ray film in the lateral plane and had shortened the duration of the operation to quite reasonable limits Mr Irwin's first slides illustrated the treatment of this fracture by tibial bone grafts and by grafts derived from the great trochanter and shaft of femur as suggested by Ellis Jones In the main, however the cases shown were treated by the use of the triradiate nail introduced by the Johanssen or King technique The recent cases were examples of the method and apparatus of Hey Groves

Treatment of Squint

DR BEATRICE LYNN read a paper on "Recent Advances in the Treatment of Squint," the purpose of the communication being to advocate the establishment of a squint centre, where amblyopic eyes could be trained to see, the fusion faculty be developed, and normal muscle balance be restored by muscle training alone or combined with operation The centre would be supplied with clinical material by the eye departments of the general hospitals, the training being carried out by skilled technicians working under the oculists Four classes of squint were described, three of these were amenable to treatment, the fourth consisting of cases of ocular lesions or cases resisting a fair trial A case was considered as cured when there was good sight in each eye, when the visual axes were parallel, and single binocular vision was obtained The average period of training was from three to six months, and judging from the figures provided by established centres an optimistic view might be taken, 75 per cent of favourable cases ending in complete cure

Maternal Mortality in London

During 1936 the deaths registered from puerperal sepsis and other accidents and diseases of childbirth in the county of London numbered 115, or 1 76 per 1,000, registered live births as against 139, or 2 21, respectively in 1935 This is the crude death rate, based on the registration figures divided by the estimated population The corrected death rate, in which the deaths of non-Londoners are excluded and which will not be known for some months, should not exceed 2 08 per 1,000 live births, as compared with a corrected rate of 2 58 for 1935 The crude maternal mortality rate given above is the lowest crude rate recorded in London The crude birth rate in 1936 was 15 8 as against 14 9 in 1935, the crude death rate 12 4 as compared with 11 2, and the infant mortality 57 per 1,000 births as against 51 in 1935 There were 541 deaths from street accidents in London in 1936 as compared with 631 in 1935, but the figure represents a large reduction on that for the years 1931–4

Additional General Hospital for South London

The appropriation of the hospitals of the London County Council as municipal hospitals, the importance and modernization so far effected, and the wider public knowledge of the municipal hospital service has led to a steadily increasing demand for treatment During the last five years the annual admissions at the eight acute hospitals south of the Thames have risen from 51,149 to 60 600 Births in the general hospitals as a whole have increased from 9,508 in 1931 to 15 375 in 1935 The accommodation at all the acute general hospitals south of the Thames has for prolonged periods and for several years past been subject to extreme pressure These big periods of pressure occur during the winter months, mainly in the first quarter of each year, and accommodation must be available to meet these maximum needs, notwithstanding that at other times the call for beds may be considerably less A new ward block of 129 beds at St Nicholas's Hospital, Plumstead, has lately been erected, and it is proposed to erect a new ward block of seventy beds at Lambeth Hospital, while additional provision for the chronic sick will result from conversion and improvement works at other institutions If, however, the demand for admissions in the Council's general hospitals continues to increase as expected further accommodation beyond that at present contemplated will be required In South London the problem is urgent in view of the period that must elapse between the inception and the completion of any scheme for dealing with it The extent of the need, to meet which preliminary steps should be taken, is difficult to assess with precision Large numbers of the com

PREVENTION OF ROAD ACCIDENTS

The campaign of the recently formed Road Accidents Emergency Council was launched at a delegate conference held in Westminster on January 23 Mr A M WALL secretary of the London Trades Council who presided said that the conference comprised religious industrial and philanthropic organizations widely diverse in character but representing in the aggregate several millions of citizens united in their demand that the appalling tragedy of the roads should not be allowed to continue The BISHOP OF WINCHESTER chairman of the council said that there was a time when the horrors of accidents in the factories of the country were regarded as inevitable But that was found to be simply wicked nonsense and it was wicked nonsense to say that nothing could be done to reduce appreciably the losses on the roads There were practical remedies When drivers found guilty of callous and reckless driving were let off with a trifling penalty it was a scandal There should be sterner and more general enforcement of the law But these reforms would not be got unless public opinion was thoroughly aroused The four point programme of the council—namely special courts for driving offences the adaptation of the roads to modern use the effective control of speed and fairer compensation for victims—was expounded by Mr A CREECH JONES M P and Mr F C WATKINS M P members of the executive council Sir ERNEST GRAHAM LITTLE M P chairman of the Road Accidents Parliamentary Group urged the testing of drivers with a view to discovering those that were accident prone the education of those whose faults could be corrected and the exclusion of those who could not be made into safe drivers Lord ELTON stressed the point that the appeal of the council was a citizen s one as distinct from a road user s one Dr ALFRED SALTER M P and other speakers emphasized the danger of alcohol as a factor in road accidents and an additional resolution asking the Government to make effective the Highway Code on that point was carried

---

S Lomholt (*Hospitalstidende* December 22 1936 p 44) has given injections of antileprol in various forms of skin disease at the Finsen Institute in Copenhagen and has achieved remarkable results in certain cases Large ulcers in several cases of nodular leprosy healed rapidly and considerable improvement was observed in many cases of Boeck s sarcoid both with regard to the rash and the general condition Permanent freedom from symptoms occurred in some cases and in those which relapsed renewal of the treatment was followed by improvement The action of antileprol on cases of lupus erythematosus was often but not invariably rapidly followed by a recurrence of the disease The benefits in certain tuberculous lesions of the skin were not so marked as to warrant much enthusiasm Among eight cases of mycosis fungoides there was one in which a permanent cure was effected In nearly all the other cases there was a change in the character of this disease large and widely distributed swellings giving place to desquamating slightly infiltrated patches of skin The results were encouraging in pemphigus The author confesses to complete ignorance of the mode of action of antileprol the marked eosinophilia observed when this treatment was first introduced may well have been due to small pulmonary emboli resulting from the intravenous injection of undiluted oil or a too coarse emulsion of it This complication has disappeared since fine emulsions have been injected The intravenous route seems to be preferable to the intramuscular and when the emulsion injected was so fine that the globules of oil were no larger than red corpuscles the potency of the drug seemed to be enormously enhanced In some cases there was a focal reaction the patients experiencing a sensation of stabbing and pricking in their lesions directly after an injection

MOVEMENTS OF THE DIGESTIVE TRACT

CINE-RADIOGRAPHIC RECORDS

Dr J RUSSELL REYNOLDS in a Hunterian Lecture delivered at the Royal College of Surgeons on January 20 described some of the results which he has obtained by taking cinematograph pictures of an x ray screen while a liquid barium meal was passing through the oesophagus stomach and small intestine of a patient

His apparatus consisted of a 16 mm cinematograph camera with a special Zeiss lens and an ordinary diagnostic x ray outfit with special screen The current in the tube is cut off by a synchronizing switch Radiologists have always recognized that a good cinematographic record of x ray appearances would be invaluable but the problem has only recently been solved for practical purposes by this combination of apparatus In physiological investigations explained Dr Reynolds it is rarely necessary to expose more than a few feet of film to obtain several consecutive cycles of movement in a given organ Positive prints are taken and the ends are joined to make an endless band which can be run through the projector indefinitely until the picture has been thoroughly studied Much more can be learnt from this record than from a screen examination

The oesophagus he pointed out appeared to be narrowed in three places where it was constricted by the inferior constrictor muscle of the pharynx where it was crossed by the left bronchus and where it passed through the diaphragm Liquid food was projected to the back of the mouth by means of an upward and backward movement of the tongue The stimulus from this sensitive area caused the suprahyoid and associated muscles to draw up the hyoid and the rest of the pharynx which was attached to it The hyoid was rotated about a lateral axis and the food was jerked probably by the back of the tongue into the pharynx which was waiting to receive it The larynx was closed by the epiglottis The liquid then passed rapidly down clinging to the sides of the oesophagus which seemed to be dilated to receive it It descended under the influence of gravity and not by means of a peristaltic wave At the thoracic inlet the food was held up either by a constriction caused by the crossing of the left bronchus or by a weak sphincter formed where the voluntary musculature joined the involuntary The food collected here in the form of a cone until it was allowed to enter the lower part of the oesophagus

When the barium meal reached the intrathoracic sphincter it might act in one of three ways Under the influence of gravity it might descend continuously in a thin stream and be held up at the cardiac sphincter The oesophagus then filled up like a test tube until the pressure of food was sufficient to open the cardia when all the food entered the stomach at once through the narrowed orifice in the diaphragm The barium passed down the posterior wall and had a horizontal upper level The food might also progress in this way with the addition at intervals of gushes of fluid which passing rapidly down by gravity entered the stomach directly without any delay at the cardia This must be due to the intrathoracic sphincter s giving way at intervals and allowing all the collected fluid to escape in a rush which would more probably happen if the constriction were due to a weak sphincter The third way in which the liquid might behave was to pass into the stomach in a constant thin stream under the influence of gravity The constriction at the thoracic inlet must then be allowing it to escape at a constant rate—a more likely occurrence if the constriction were purely mechanical as that due to the crossing of the left bronchus There was no delay at the cardiac orifice and the liquid went direct into the stomach It appeared to pass mainly down the posterior wall of the oesophagus

as fat, bread, or oatmeal All the available evidence, the speaker continued, indicated that deficiency diseases like rickets would disappear, and that infant mortality rates would be reduced to less than one-half of what they were at present if every family in the country enjoyed a diet on such standards Public health departments were doing much to improve the diet of the poor by providing free or cheap meals in necessitous cases, and this helped to prevent the grossest forms of malnutrition A further step in the right direction was the milk-in schools scheme, which provided a third of a pint of milk for one halfpenny, but the amount required by the children was a pint and a half daily National schemes concerning food had unfortunately been dominated by economic interests and this was largely due to ignorance of the extent to which the health of the nation could be improved by better feeding The Government could not move in advance of public opinion, and what was most needed at the present time was further enlightenment of the public The country had now dealt with education, and there was a national scheme designed to provide a decent house for every family, but the next great social reform should be a national food policy to make a diet adequate for health available to every family Increased production in this country of foodstuffs needed to bring diets up to the required standard would bring prosperity to agriculture and the retail food trade as well as furnish the permanent national asset of improved health and physique

Consultant Physician for Highlands and Islands

The Public Health Committee of the Ross-shire County Council at a meeting on January 26 discussed the proposal to appoint a consultant physician at the Royal Northern Infirmary, Inverness, for the benefit of the Highland communities It is proposed that such a consultant should be appointed to have charge of twenty beds in the Royal Northern Infirmary Inverness and should be allowed to carry on private consulting practice It was stated that there are four or five expert physicians in Inverness whose services could be obtained, but the present suggestion is that the various county councils should contribute to the salary of a consultant on the basis of the number of patients from the respective counties who had been treated in the Infirmary during the past five years The Ross shire Public Health Committee had been sympathetic towards the proposal but it withdrew from the scheme because the Island of Lewis was not to be included, and this amounted to cutting off a large part of Ross shire It was ultimately agreed that if Lewis was included in the scheme the Ross shire Public Health Committee would reconsider its attitude, which at present was one of disapproval

Edinburgh Royal Infirmary

At the annual meeting of the Court of Contributors to the Royal Infirmary of Edinburgh Sir Thomas Whitson, referring to the annual report of the institution (summarized in the *Journal* of January 9), said that it was expected that arrangements would be made to have fee-paying patients in a particular ward Meantime the Board was taking all the facts into consideration and it wanted to find out how contributory schemes worked in England A subcommittee had been appointed to go into the question but he could not as yet give any idea of what the Board's final decision would be The recently opened new department for venereal and dermatological diseases had set free certain other wards, of which one would be used to provide beds for accidents and emergencies, while another after reconstruction would be used for orthopaedic cases Another ward would be set free for less urgent cases such as hernia, haemorrhoids, etc which constituted a large proportion of the waiting list while still another ward would be reconstructed for neurological surgical cases The managers were tackling the question of bringing the radiological department up to date The school of dietetics had now completed its second year with great success

Correspondence

Cancer of the Breast

SIR,—We owe to Mr Geoffrey Keynes the first prolonged experiment in the treatment of breast cancer by radium alone, but his letter (*Journal*, January 30, p 242) makes claims for the hospital he adorns which are too large to be defensible He says "Radium technique has not stood still since it began to be developed at St Bartholomew's about twelve years ago and its value and limitations in cancer of the breast began to be fairly clear"

It is now thirty years since I worked out in detail the mode of spread of breast cancer by evidence which has never been controverted No pathologist since has had the patience to adopt those "microscopical methods on a macroscopic scale" which are necessary for such work The operation based on my findings has met with an acceptance which is world wide, as Mr Cecil Rowntree (January 23, p 153) generously recognizes, and has almost abolished local and abdominal recurrence I soon found, however, that frequent late thoracic recurrence cannot be prevented by any operation, however rational and complete I was able to prove that the internal mammary glands, which are in practice inaccessible to operation, are invaded at about the same time as the axillary glands Enlarged axillary glands, which are present at the time of operation in a large percentage of cases, indicate infection of the internal mammary glands It followed that in very many cases the disease is already, at the time of operation, an intrathoracic disease

It appeared to me logical to deal with the extrathoracic disease by operation, and to employ radiation from radium tubes introduced at the time of operation to deal with the intrathoracic extensions in the internal mammary glands This has been my routine practice for sixteen years, and is still It has abolished the recurrences at the inner end of the upper intercostal spaces which are still frequent in the practice of some surgeons, as they were formerly in my own It has raised my non recurrence rate at the end of three years from 47 to 57 per cent No more could be expected in view of the tragic delays to which women with lumps in the breast still subject themselves

How, then, does Mr Keynes maintain that radium technique "began to be developed at St Bartholomew's twelve years ago"? Four years earlier I had assigned to radium its own special place as a routine adjunct to operation to deal with deposits beyond the reach of the knife That place it unassailably holds but Mr Keynes's gallant attempt to make it do all the work must, I think, be held to have failed, even though, in the distribution of his tubes, he has had the advantage of Middlesex Hospital pathological work to guide him Even in his practised hands radium has given no better results than surgery, as he admits, and his letter rather suggests that he is abandoning the use of radium alone for a combination of radium with "very conservative" surgery

I do not wish to decry "radium alone" It is very useful for inoperable cases and for growths at the periphery of the breast These are valuable extensions of the role I had assigned to radium in breast cancer sixteen years ago It may be offered as a slightly speculative alternative to the radical operation with intrathoracic radium, which in my view still represents the gilt edged investment in breast-cancer therapy "Radium alone" is

Reports of Societies

EXPERIMENTAL AND LABORATORY TRAINING IN MEDICAL EDUCATION

The value of experimental and laboratory training in medical education was debated at a meeting of the Medical Society of London on January 25 Sir WILLIAM WILLCOX presiding

Dr JOHN BEATTIE defined the aim of experimental training as the inculcation of the experimental method whereas laboratory training was a training in technique and use of methods The vocational value to the medical student of a training in the experimental method altogether apart from the factual content of the sciences using the method had been the subject of various comment John Hunter wrote to Jenner Don t think try Astley Cooper paraphrased it First observe then think Claude Bernard expanded it further Think observe try and think Huxley described the scientific method as trained common sense Laboratory training on the other hand was directed to enabling the worker to use methods which ensured accuracy under known conditions A distinction must be drawn between the intrinsic value of the subject matter of a science and the educational value of that science No one would challenge the intrinsic value of Greek literature and philosophy and its influence on modern civilization and modern methods of thought but the value of a classical education to the average schoolboy was quite a different thing Too often were a dozen schoolboys sacrificed on the altar of classical education which was of real educational value to only one of them

It was only by inculcating at an early age the true scientific method that education by things and not by books could be obtained Medical education now began—unfortunately he thought—in the secondary and public schools where the preliminary sciences were taught with great damage often to the experimental outlook of the students Training in the experimental sciences was much more than an acquisition of facts It was infinitely better that a student should arrive at a natural law such as Boyle s law by the use of direct experiment in the laboratory than by the teaching of the law by lecture or textbook When the student went to the medical school there were five chances to one that he did not know how to learn and certainly ten chances to one that he did not know how to think Yet during his first two years in the school he was presented with a cold douche of facts to chill his enthusiasm make him doubt his ability to learn and leave him scarcely time to think He had only too often seen a student when told to make a drawing of a microscope slide proceed to put in the drawing structures which definitely were not in the slide but which his textbook had told him ought to be there

In the anatomy school for example too often the students were lectured to in such a way that their curiosity and inquiry into the facts of anatomy were stifled and their interest instead of being directed forwards so that their training was a real training in observation and not only a memorizing of facts was directed backwards retarding the development of the scientific method of thought which was so satisfying a part of a man s mental equipment With the wealth of material in anatomical laboratories it should certainly be possible to lead the student away from considering his final examination the ultimate object of his course and to train him in manipulative technique accurate observation and logical deduction which the average student so badly needed

Scientific Education of the Doctor

On the value of the experimental method (Dr Beattie continued) there had been a great deal of confused thinking Oliver Wendell Holmes in 1867 at Harvard said that if a man had got plenty of common sense the more science he had the worse for his patients But what he really meant was surely to commend the scientific doctor (*vide* Huxley s definition above quoted) and to condemn the man whose factual knowledge which Holmes confused with science was extensive while his outlook was unscientific The successful education of the doctor depended on the emphasis laid on the method and spirit of science rather than on the subject of the science itself The principle do it yourself was the real method of training

The methods of the diagnostician were essentially those employed in procuring all scientific data—namely accurate observation with experiment if necessary and consequent logical deduction Clinicians often remarked that what was needed more than anything else in the education of the medical student was experience implying some mysterious added sense Experience was only obtained by continuous training in accurate observation and deduction which furnished the ability to reach a conclusion by a short cut not immediately apparent to a beginner Valuable experience could only be obtained by the careful painstaking methods of the scientific observer the personal acquisition of knowledge not by the second hand method of books and lectures In teaching medical students it was important for them to obtain their knowledge for themselves instead of having their path smoothed by an increased number of lectures demonstrations and clinics The supervision of the student by telling him what to do to a certain extent how to do it but not what to find was the best procedure It had been said that it was a disgrace to a university to appoint a man as a professor because he was a good teacher it was only investigators who could give university instruction

Dr Beattie concluded by comparing British and American methods of medical education on the whole to the advantage of the former and added that there seemed to be no historic or modern reason why the scientific method in the approach to medicine should be called in question If the purpose of the medical schools was to turn out efficient practitioners that was only another way of saying that they must be expert scientific investigators

A Dual Curriculum?

Professor J A RYLE said that no one despised the importance of experimental and laboratory training but the relative merits of laboratory and bedside teaching might reasonably be reviewed Was the training which was suitable for the intending practitioner equally suitable for the intending medical scientist (the pathologist physiologist biochemist and so forth)? A friend of his a pathologist had said that there might have to be devised two curricula to meet these (in a measure) conflicting requirements It had now become customary for students to do their preliminary scientific work at school with the result that they were to some extent compelled to become specialists from the age of 16 The education was often cramming rather than training They were given a certain number of facts to learn they had to follow a syllabus and get up those facts in order to get through the examination but that was not providing them with a proper introduction to the experimental or observational method

After this came three or more years devoted to anatomy physiology histology and introductions to biochemistry and pathology so that for four years the life of the medical student was devoted to laboratory studies before there was any contact with a patient or a clinical problem

There were certain advantages in this training—an insistence on the importance of accuracy a training in the use of tools such as the microscope an introduction to the scientific attitude But this introduction had largely to do with books and classes lectures and set demonstrations and as a rule little time was given to actual experiment, little encouragement to any sort of

Prevention of Silicosis

SIR,—We have read with much interest Dr G P Crowden's article on "Preventive Medicine in Industry" in the *Journal* of December 5, 1936 (p 1155), and the letters of Drs Goodfellow, Craddock, and Blacklin which followed it Dr Blacklin referred to air contamination, and suggested that such agencies might be concerned in silicosis We can, perhaps, go further than this One of us (A E B), in co-operation with colleagues, is at present engaged in investigating the subject of broncho-moniliasis in coal miners, and has already collected some important experimental data The other (R F) has examined radiologically the chests of a large number of haematite iron-ore miners in the Furness and South-West Cumberland areas In their youth many of these miners were farm workers, and R F recently published a paper (*Brit J Radiol* 1936, N S, March and June, 1936) that dealt with, *inter alia* broncho-mycosis in such farm workers The similarity between the radiographs of the chests of these cases of broncho-mycosis and those of some of the miners was quite definite R F accordingly made some investigations among the workers and in the mines He isolated from the sputum of miners, collected with all due precautions and *before* they went down "on shift" fungi of the same type as those which he found in the air of the mine the timber, and the ore with which these men were working The radiographs of the chests of these 'healthy' miners showed ill-defined but definite departures from the normal of the type that had been seen in the farm workers

As a result of our findings to date we feel that there must be at work some predisposing factor or factors which influence the incidence of silicosis In a letter such as this it is not possible to go into detail, but we hope in the near future to be able to publish both clinical and experimental findings supporting the hypothesis that dust diseases are in reality secondary to some primary condition probably infective in character, which impairs the normal extremely effective excretory action of the cilia of the respiratory tract—We are, etc

A E BARCLAY (Oxford)
February 1 RICHARD FAWCITT (Ulverston)

SIR,—I am obliged to Dr A L Craddock for directing my attention to the valuable work of Dr Donald Hunter on industrial diseases, including silicosis (*Journal*, January 23rd, p 194) In trying to visualize the manner in which the silica crystals damage the lining of the alveoli I have never pictured a violent impact like a dart from a pea-shooter It is highly probable that long before the particles reach their journey's end they have lost all their momentum Nevertheless it is still possible that the sharp points of the crystals may contribute to the resulting damage If the crystals are passive the lung itself certainly is not and its movement against jagged edges or rough surfaces may produce an abrasive action For my suggested experiment however, it is immaterial whether the damage to the alveoli is due to the physical properties of silica or to its chemical and poisonous nature Most authorities are agreed that the fatal termination of the disease is due to secondary infection and that the invading germ is usually, but not always the tubercle bacillus If that is the correct view it follows that if we could prevent the silica wound however caused from becoming infected life would at least be prolonged Hence my suggestion that breathing iodine vapour in an attenuated form should be tried

Dr Craddock says the provision of an iodized atmosphere would be both impracticable and expensive Therein he is wrong it is quite easy All you have to do is to put some solid crystalline iodine in a stoneware container, having all or part of its surface left unglazed The opening is sealed and the iodine vapour then escapes through the porous walls over a long period The rate of diffusion depends on the area of unglazed surface, the degree of porosity, and the temperature I have ample evidence that an iodized atmosphere produced in this way is effective Over two years ago, when I first visited the Clay Cross Company's Grade A milk farm, the manager, Captain Cartwright, called my attention to a number of heifers that were being fattened for the butcher because of their sterility There were eighteen in all, and for months they had been having an iodized mineral mixture The pens and sheds were iodized by the stoneware method I have indicated at a cost of about 10s, and in a very short time fourteen of these heifers were in calf No further sterility trouble has since occurred This is by no means an isolated example I am now making arrangements to test the same method in the case of barren mares It is rather startling to be told that all over England and Wales on an average only about 50 per cent of the mares are fertile after service

Last summer, in my experimental poultry pens, I reared in an iodized atmosphere twelve chickens whose droppings showed that they were affected with coccidiosis, but apparently without suffering any inconvenience Two were removed to a non-iodized cage for a week Both showed blood in the droppings and stopped growing When returned to the iodized atmosphere they quickly recovered and grew normally These experiments will be repeated and multiplied this summer At present I am carrying out a big experiment with calves It is my intention to have reared from birth in an iodized atmosphere 200 calves on Derbyshire farms without any extra expense to the farmers The experiment will be continued until they grow to maturity and have had two or three calves of their own They will be tuberculin tested annually I hope in this way to prove that calves so reared will resist tuberculosis

If these and other experiments come up to expectation it is obvious that in the provision of an iodized atmosphere we have a new weapon with which to fight germ invasion and an improved means of perfecting our physiological development particularly in relation to reproduction It was the success that has already been attained by the use of this method that led me to suggest in your columns that it might be tried in silicosis—I am, etc,

Chesterfield, Jan 28 J A GOODFELLOW

Exanthema Subitum

SIR—I have recently seen several cases of exanthema subitum in and around London, and I am writing to inquire whether small epidemics of this nature are also occurring in other parts of England

The complaint, which is chiefly confined to children under 2 years, is perhaps not well recognized in this country The three days fever, subsiding suddenly with the advent of a rash, may prove puzzling and has no doubt sometimes led to the mistaken diagnosis of measles In that event measles occurring later in the same child may be thought to be a second attack Very little is known about the cause but cases have been reported when there is an epidemic of influenza as at the moment The cases I have seen have run a favourable course as is usual in this disease but caused considerable alarm during the height of the fever—I am, etc,

London W 1 Feb 1 BERNARD SCHLESINGER

and guarded having put aside prejudices and preconceptions and this was the attitude of mind which it was the first duty of the medical school to foster Laboratory training helped to this end because it was primarily the place where tentative hypotheses were put to the test A man working in a laboratory was initiated into the nature of evidence and there was nothing else in the practice of his calling that was quite so important to him But this was not the only educational value of a laboratory training Long ago Priestley put his finger on the essence of science teaching when he said that in this manner the interest and curiosity and surprise of youth were kindled The two main functions of a medical school were to sharpen the student's powers of observation and to train them to gather the results together as a general conclusion or diagnosis—in a word to teach them the habit of inductive reasoning—and a laboratory was an admirable school for both Any youthful intelligence that was alert was fascinated by experimental inquiry which in Bertrand Russell's phrase is perhaps the most godlike thing men do

Colonel A H PROCTOR expressed the view that the medical student got very little of the experimental method *in his education to-day He saw a lot of experiments* made a lot of observations but the experimental method as he understood it was left out of the bill It was a method whereby on a certain phenomenon being observed a certain experiment under controlled conditions was made in order to test a hypothetical explanation The student was usually told the explanation long before he had made the experiment A good deal more might be done for the medical student in his earlier years in *encouraging him to observe certain phenomena and devise* experiments to explain them

General Discussion

Dr JOHN FREEMAN said that the trouble with the medical schools was that everybody who taught was a specialist and it was assumed that every student was going to be a specialist too He had remarked to a student What you want is to get a general view of this Don't bother about the permutations of the micro organisms and at once more than one man said But that would have lost us our last examination Men were being crammed with stuff they could not possibly want in general practice *Dr GORDON W GOODHART said that the idea of a second* curriculum was new to him There were not two distinct kinds of workers in medicine but he thought there were bound to be two different kinds of people or people with two different attitudes of mind On the one hand there were people whose primary aim was the study of disease and on the other those who like the great clinicians of the past and present were not engaged in the study of disease but of the patient He could not agree *to the suggested dichotomy and he illustrated his* contention by a reference to pathology When he himself as a student went into a pathological laboratory he was told by his chief that if he wanted to do any good in pathology he must give up any interest in clinical medicine an attitude of mind which he thought wholly wrong

Dr LIONEL WHITBY said that the doctor must have a fundamental basis of fact before he could attempt to be an experimentalist It was of no use presenting the student with a complicated experiment and asking him to interpret the result unless he had some fundamental facts on which to base his experiment The student must not be expected to run before he could walk He was not really fit to be a true experimenter until he had passed through the basic part of medicine The curriculum as designed at present was fundamentally sound but the student had to be trained in the same way as an army marched accommodated *to the slowest pace*

Sir WILLIAM WILLCOX commented upon the interest of the discussion a particularly important one at the present time when the revision of the curriculum was still under consideration

COURSE AND MANAGEMENT OF CONGENITAL HEART DISEASE

At a meeting of the Section of Medicine of the Royal Society of Medicine on January 26 Sir CHARLTON BRISCOE presiding a discussion was held on the course and management of congenital heart disease

Professor BRUCE PERRY limiting his remarks to types of congenital cardiac defect which were compatible with life and recognizable clinically said that two great difficulties were encountered in prognosis and treatment In many cases it was impossible from the physical signs and symptoms to diagnose accurately the actual anatomical defects present even when assisted by radiology and electrocardiography Again the influence of cardiac abnormality on the patient's life varied widely according to the defect present and therefore some general classification based on symptoms was necessary Maude Abbott's classification into cyanotic and acyanotic was acceptable on a clinical basis The acyanotic cases needed no restriction on activity and lived normal lives but ran the danger of an engrafted endocarditis It was important therefore to eliminate any possible source of infection sepsis in the mouth and upper respiratory tract was a potent cause Again if the position was not clearly explained *to the parents the child might be so pampered* and coddled as to develop a cardiac neurosis Cases with an arterial venous shunt needed the same management and had the same outlook as the truly acyanotic cases with the exception that pulmonary disease or infection might be rendered more serious than it would otherwise be by the reversal of the shunt and the development of a severe cyanosis In cyanotic cases the amount of restriction required was determined by the degree of cyanosis and symptoms Cases which showed cyanosis at or soon after birth rarely survived beyond five years If the cyanosis was delayed until the child started a more active life at the age of 5 the child was likely to reach puberty A moderate cyanosis developing at or after puberty as might happen in a case of the so called Eisenmenger complex was not incompatible with a comparatively long even though restricted life

Was there any relationship between congenital heart disease and pulmonary tuberculosis? School children with a patent interventricular septum led active lives and physical signs might disappear suggesting the obliteration of the opening He mentioned two cases which developed acute rheumatism The other acyanotic types commonly found in school children—subaortic stenosis pulmonary *stenosis and patent ductus arteriosus—produced no symp*toms except that children with the last condition might be easily fatigued possibly owing to an associated hypoplasia His general conclusion was that cases of cyanotic heart disease should lead restricted lives the degree of restriction depending on the severity of the cyanosis and other symptoms

Possibility of Survival

Dr TERENCE EAST said that from a general point of view the division of the cases into cyanotic and acyanotic was of considerable practical value The presence of cyanosis depended upon two fundamentally important causes—*namely the hindrance* of access of the blood to the lungs and the presence of a right-left shunt allowing the unoxygenated blood to return into circulation The grade of cyanosis was a fair indication of the importance of the part that either or both of these factors were playing Atresia of the pulmonary artery was *the extreme* example of the first of these factors In some cases the blood reached the lungs through a patent ductus In a case in which he did the necropsy the ductus was closed and the blood reached the lungs by very large bronchial arteries there was a large hole in the septum of the ventricles In this patient who died at the age of 33 no murmur was heard He quoted this and another case as instances of the possibility of survival with gross dis-

typing the samples of blood received for the Wassermann tests each week, and to preserve sera and corpuscles from week to week so that adequate supplies would always be available This would, however, be a rather laborious method of preparation for a few tests

Another difficulty is that of maintaining a supply of the sera M and N These must be specially prepared, and their preparation for occasional tests would be quite impracticable The sera used in Berlin are prepared by the Behringwerke and supplies can be obtained in this country through Bayer Products Ltd These cannot be kept in stock as they deteriorate rapidly, and are useless in from one to two weeks after receipt They must therefore be obtained from time to time as required, and only in sufficient quantities for immediate use I have used these sera and have found them satisfactory By their use I have been able to show that the order of the occurrence of the M and N groups in Yorkshire is the same as that given by Schiff for Germany and Thomsen for Denmark—namely, MN, M, N

I believe that so long as the demand for these tests remains small their performance could be simplified and made practicable if suitable sera could be issued from a central laboratory recognized for the purpose of preparing all kinds of sera used in medico-legal work The difficulties mentioned would naturally disappear as the number of tests increased, as would be the case if legislation were introduced, but even then it would still remain advisable to use only M and N sera issued by a specially recognized laboratory Should a demand for the tests become frequent pathologists should come to some arrangement among themselves as to the technique to apply, and as to the minimum age of the infant before which the test should not be undertaken On the latter point particularly there seems to be considerable variation in opinion—I am, etc,

Public Health Laboratory, Wakefield, Jan 26 P L SUTHERLAND

Faints and Fits

SIR—Dr A Rae Gilchrist, in his lecture on faints and fits in the *Journal* of January 30 (p 203), refers to seizures resulting from a disturbance of the autonomic nervous system, and describes symptoms very similar to those recorded by Zondek (1935) as resulting from what he calls hyperinsulinism

I have recently seen several patients giving a similar history, who have been found on blood examination to have a low blood sugar, and in each case these patients have consulted me on account of pyorrhoea alveolaris Now I view pyorrhoea not as a disease entity but as a symptom of a general disturbance based upon vegetative imbalance, a disturbance of sympathetic-vagal tone in the direction of vagus plus, associated—according to Kraus and Zondek—with an increase in OH over H ions in the body fluids (alkalosis), of potassium ions over the calcium ions in the body cell, of thyro-adrenal deficiency, and with hydration of the blood colloids

McDonagh, whose work on the blood colloids deserves greater appreciation, points out that with colloid hydration there comes about an increase in the adsorption of the blood constituents—of which sugar is one—so that they tend to pass from the plasma into the "colloid complex," and are therefore not available for analysis To this circumstance he attributes such conditions as hypoglycaemia and believes that the normal action of insulin is to hydrate the colloids while that of the thyroid and adrenal secretions as also that of glucose, is one of dehydration In this manner we get an association of pyorrhoea hypoglycaemia (hyperinsulinism) and a tendency to fainting, but none of these conditions become entities, each and all being parts of one syndrome This conception is strengthened by the fact that psychic stimuli may precipitate a fainting attack, but only in those subjects with definite stigmata of the particular syndrome All are patients with slow pulses and low blood pressures, many present allergic manifestations—dermographia is an almost constant sign—and all are, I believe, potential allergics

I treat pyorrhoea with subcutaneous injections of oxygen, and contramine intramuscularly, the patient's anticipation of the introduction of the needle is in the first instance at times enough to bring about a typical attack of faintness, which, however, never occurs at subsequent treatments, oxygen and contramine acting as dehydrators of the blood colloids more permanently than adrenaline The rationale of the effect of the psychic (fear) stimulus is, of course, a collapse of the already inefficient thyro adrenal system on the addition of an extra strain (Cannon and Crile)

I submit that in the search for disease entities, through differentiation of signs and symptoms, scientific medicine suffers a disservice, and mysteries are created unnecessarily If in its place an attempt were made to correlate rather than to differentiate it would be found that medicine is a much more simple practice than at present appears, the number of essential entities being reduced enormously, and treatment thereby simplified, the search for specific treatments would be abandoned and simple rational methods would become more obvious

In the same issue of the *Journal* you publish a paper by Dr James L Halliday (p 213) on the psychological factors in rheumatism, thus giving two approaches to the study of disease as different from each other as it would be possible to conceive, and which can only be associated by some such visualization as I suggest Dr Halliday's paper, in effect, shows that rheumatism is a symptom and not an entity, that it is produced through an environmental strain upon a certain diathesis, similar in every way to Dr Gilchrist's cases of fainting, even to the diathesis being a result of vegetative inefficiency, which must be the fundamental cause of all biochemical and biophysical change

As the dermatologist is beginning to realize that urticaria and seborrhoea are not essentially diseases of the skin, as the gynaecologist is beginning to appreciate that dysmenorrhoea, menorrhagia, and amenorrhoea are not exclusively diseases of the uterus and the ovaries, as the orthopaedist is beginning to understand that arthritis is not primarily a disease of the joints, as the internist now understands that gastric and duodenal ulcer and diabetes are not, fundamentally diseases of the stomach or the pancreas, the neurologist must see that migraine, epilepsy, and melancholia do not depend entirely upon brain dysfunction, the laryngologist that enlarged tonsils and adenoid overgrowth and nasal catarrh are not diseases of the nose and throat, the ophthalmologist that glaucoma and cataract are not primarily diseases of the eye so must the dentist come to understand that dental caries and pyorrhoea are not diseases of the teeth

All these conditions are but symptoms of some generalized disturbance based upon diathesis, which means when sufficiently dissected vegetative imbalance, plus some environmental strain, or else they are end points of disease the consequence of long-continued malfunction dependent upon the same circumstance This conception is in accord with the excellent leader in your issue of January 9 (p 78) on "Tendencies of Contemporary Medicine," and with Dr Robert Hutchison's Gilchrist Lecture published in the same issue—I am, etc,

Bournemouth, Feb 1 F W BRODRICK

RUPTURE OF THE UTERUS

A meeting of the North of England Obstetrical and Gynæcological Society was held in the University, Liverpool, on December 11, 1936, with the president, Dr RUTH NICHOLSON, in the chair. Dr D. C. RAPER (Manchester) read a short paper on ruptured uterus, including notes on three cases treated recently in St. Mary's Hospital, Manchester.

In all three cases the technique carried out had been the same—namely, supravaginal hysterectomy, combined with blood transfusion and gum-saline infusion by the continuous drip method. One patient had been in the hospital since just before labour began. Diagnosis was made immediately after rupture and he had at once opened the abdomen and performed a supravaginal hysterectomy. In the two other cases the uterus had ruptured before admission, and one patient was almost moribund on arrival after a long journey. In no case had there been previous Cæsarean section, but all had had difficult deliveries before. Two patients recovered completely after a rather stormy convalescence; the third, who had been so ill on admission, died eight hours after operation. The anæsthetic employed was nitrous oxide and oxygen in one case, morphine and local (novutox) in another, and ether in the third.

Dr. RICKER drew attention to the fact that the incidence of rupture of the uterus was not decreasing, but rather increasing, in comparison with thirty years previously. This could not be attributed to the increased frequency of Cæsarean section, since the figures for rupture through an apparently normal uterus were not diminishing. The aetiology of the condition was briefly surveyed, with special stress on the various causes of rupture through an apparently normal uterus. The speaker thought that in these cases there had probably been some previous trauma to the uterus, even a partial or incomplete tear which had passed unnoticed. He therefore emphasized the importance of a thorough intrauterine examination following all difficult instrumental or manipulative deliveries. In regard to treatment he felt sure that the method of choice in all cases, with the possible exception of small incomplete tears, was a supravaginal hysterectomy. In old Cæsarean scar ruptures from the point of view of the patient's condition it might be better to quickly suture the torn edges; this however should be followed later by sterilization. He felt very strongly that no patient who had had a ruptured uterus should be allowed to become pregnant again. Dr. Ricker thought that treatment per vaginam had no place apart from small incomplete tears. Intrauterine tamponage had always given extremely poor results. Extraction of the child if the presenting part was low, followed by operation, although tempting, should be resisted. It might increase the hæmorrhage very alarmingly, bring intestine or other viscera down with it, enlarge the tear and greatly lengthen the time before operative treatment could be instituted. Figures from the literature were quoted to show how the mortality following ruptured uterus suddenly decreased in about 1900 with the introduction of hysterectomy as a method of treatment before this nearly all cases were fatal. At the present time the mortality was still alarmingly high—about 25 to 40 per cent. in various clinics. The prognosis depended chiefly on two factors: first the interval between the accident and operation, early diagnosis and prompt treatment being the keynotes of success; and secondly the amount of bleeding, whether the placental site had suffered or a large vessel had been torn. In a large number of cases provided that there had been no vaginal manipulations the bleeding might be surprisingly little, even where the fœtus was lying free in the abdominal cavity. The third most important factor was probably sepsis; this might be immediate or remote and ranged from peritonitis and pelvic abscess to thrombosis and emboli, subphrenic abscess and empyema. Most patients had a somewhat stormy convalescence, but with suitable treatment they should be discharged in a healthy condition.

Mr. A. A. GEMMELL (Liverpool) gave details of a case which he had attended recently. The patient was admitted to hospital after failed forceps. It was found necessary to perform Cæsarean section, and after removal of the child a vertical tear was seen in the posterior wall of the uterus. This was sutured, and after a somewhat stormy convalescence the patient recovered. Dr. RHODA ADAMSON (Leeds) thought that trauma at a previous confinement was not necessarily as an ætiological factor. She recalled a case of an 8-para who had had easy confinements previously but who, during the first stage of labour, had ruptured the uterus as a result of turning suddenly from her back on to her side. She died within ten minutes, and at post-mortem examination a large uterine tear was found. Dr. BRIDE (Manchester) recalled a case of rupture where the uterus was infantile in type. Dr. GERRARD (Manchester) supported Dr. Ricker's contention that previous trauma was an important ætiological factor. He pointed out that spontaneous rupture in a primigravida was a rarity.

Labour Obstructed by Pelvic Kidney

Mr. T. N. A. JEFFCOATE (Liverpool) reported an unusual case of obstructed labour.

The patient, aged 26, was first seen at the thirty-sixth week of her sixth pregnancy. She had had one previous abortion and four previous labours, of these 1 of the first three had been normal, but the fourth in 1932 had been difficult and necessitated forceps delivery. When first seen her general health appeared excellent, but on routine antenatal examination a cystic swelling was found behind and slightly to the left of the uterus. The exact limits and size of this swelling were difficult to define, but there seemed to be no doubt that it was an ovarian cyst which was below the presenting head and was almost certain to obstruct labour. The previous history of labours increasing in difficulty supported the diagnosis. She was admitted to hospital and allowed to go into labour spontaneously on June 30, 1936. After being in labour eight hours the cervix was two fingers dilated, the membranes had ruptured, and the head was high above the cystic swelling. Lower segment Cæsarean section was performed under general anæsthesia, and a living female child weighing 7 lb. 4 oz. was delivered. The uterus having been sutured, the pelvis and abdomen were explored, and the operator was horrified to find no tumour. The uterus was unicornuate, and there was no appendage on the left side. A little thickening beside the pelvic colon was noted, but nothing to account for the obstructed labour. The placenta had been situated rather low down on the left wall of the uterus, and it was concluded that the sensation of a cystic swelling must have been produced either by the placenta or by a sacculation of the malformed uterus. The puerperium was uneventful except for mild pyelitis associated with a slight rise of temperature on the fourth to ninth days. This responded quickly to treatment with alkalis. Careful bimanual examination one month after operation revealed no abnormal physical signs, and Mr. Jeffcoate failed to excuse himself on any grounds for what he thought to be a gross error in diagnosis.

The patient was next seen in October, 1935, when she was pregnant again, the last menstrual period being possibly May 19. On examination the uterus was found to be enlarged to the size of an eighteen weeks pregnancy, and no unusual physical signs could be detected on vaginal examination. However she was observed closely and with great interest and examined repeatedly. At the thirtieth to thirty-second week of pregnancy the tumour again made its appearance and became more obvious as pregnancy advanced. The case was discussed with a number of colleagues, all agreed that the correct treatment was to institute trial labour again, but they were unable to suggest the pathological nature of the condition. At the thirty-fifth week the presenting head was high, and pus and albumin appeared in the urine. This onset of urinary infection was not surprising in view of her previous attack of pyelitis in

there was only a small puncture wound in the left leg Prophylactic serum was given as in Case I The wounds were excised and both legs put up with a weight extension to a Kirschner wire through each os calcis The following morning the x ray films showed gas in the tissues of the left leg and by evening there was definite crackling Amputation through the upper third of the thigh was performed Serum was continued as in Case I The man is still in hospital, as sepsis supervened and the amputation stump has been remodelled, the gas-gangrene infection has, however, been overcome

Case III—This was also due to a street accident on December 16 1936 There was a compound fracture of the right tibia and fibula with very severe damage Amputation was carried out on the following morning The amputation was through the upper third of the tibia Prophylactic serum was given as in Cases I and II The following morning there was discoloration and swelling of the stump flaps, and later gas could be felt and was seen in the x-ray plate Amputation through the upper third of the thigh was performed The patient is still in hospital and there is some sepsis in the stump, but the gas-gangrene infection has been successfully overcome and the man is well

In each case the wound was only loosely sutured and packed with hydrogen peroxide gauze after amputation Although the onset of gas gangrene was very rapid in one case the spread appears to have been slow, presumably due to the prophylactic serum given In one case x-rays definitely revealed the gas some hours before it could be felt clinically The satisfactory results in these three cases seem to be attributable to the combined action of the serum, which, although it did not prevent the onset of the disease, made the spread slower, and the timely intervention of surgery—I am, etc,

Bute Hospital, Luton, Jan 21

Professional Secrecy A Medical Privilege Bill

SIR—Having won an early place in the ballot for Bills, I have been allotted a time on Friday next, February 5, to introduce a Bill, and I am taking this opportunity of presenting a measure to secure privilege under certain conditions from disclosure of communications made to medical practitioners by their patients under the seal of confidence I append the text of the Bill as it is printed and as I propose to present it I may say that some of the clauses especially those relating to the prevention of crime or fraud have been drafted for me by Lord Atkin, who has publicly stated his opinion that some measure of professional protection should be afforded to medical practitioners as it is to solicitors, for example

In November, 1927, I obtained under the "Ten Minutes Rule a first reading for a Bill in essentially the same terms as my present Bill with the exception that in the earlier Bill I was advised by legal members in the House to limit the operation of the Bill to cases of venereal disease that limitation being suggested by the fact that patients attending venereal clinics under the aegis of the Ministry of Health are assured upon coming to the clinics by leaflet and personal promises that their confidences will be respected This protection was found to be illusory some short time before I brought forward the early Bill, and several legal members of the House assured me at the time that they agreed with the Bill as it then stood indeed a number of eminent lawyers gave the support of their names on the back of my Bill These were Sir Walter Greaves-Lord K C, Mr (now Sir) F Boyd Merriman K C, Mr Hopkin-Morris Mr Goodman Roberts and Mr Storry Deans K C I did not proceed further with the early Bill, as inquiries convinced me that even if the Bill passed the Commons, the Lords, led by Lord Birkenhead, would reject it

I believe there will be less opposition now from legal members of both Houses, and this belief, as well as another consideration, has weighed with me in making my new Bill of wider application The drawback of limiting the Bill to venereal diseases is obvious in that any person pleading its protection in a court of law would by implication be liable to the imputation that he was suffering from venereal disease

At the ninth International Congress of Dermatology held in Budapest in 1935, when I was president of one of the six committees appointed by the congress, the purpose of my committee being the consideration of medical problems affecting public interests, I chose as one of the subjects of my committee the discussion of the degree of protection awarded to the "professional secret" in those countries represented upon the committee, which included members from nearly every State in Europe and from the United States It became obvious that the protection given to the "professional secret" abroad was much more efficient than in our own courts, and no miscarriage of justice from this protection was recorded by the various speakers That widely distributed experience should dispel any fears entertained by the lawyers in our country that the protection afforded by my Bill, safeguarded as it is from improper use, would be followed by untoward results—I am, etc,

E GRAHAM LITTLE

House of Commons, Feb 1

*** The text of the Bill and its preamble is as follows

A BILL to provide that certain communications between medical practitioners and their patients shall be privileged from disclosure in evidence in courts of law

Be it enacted by the King's most Excellent Majesty by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same, as follows —

1 Any information obtained by a duly registered medical practitioner in the course of treatment of any patient shall be regarded as confidential, and shall be privileged from disclosure in a court of law

Provided that the information obtained shall have been obtained for the purpose of a cure, or assisting in a cure, of a patient so treated, and provided also that this privilege (*a*) shall not extend to any communication made with the object of committing, or aiding in committing, any fraud or crime, and (*b*) shall not extend to any disclosure in any court of law in any case founded on a criminal charge or charge of fraud against such patient

2 For the purpose of this Act 'duly registered medical practitioner' shall mean a person whose name is on the *Medical Register*

3 This Act may be cited as the Medical Practitioners' Communications (Privilege) Act, 1937

Analysis of Clinical Statistics

SIR—In Dr Mainland's original article on the analysis of clinical statistics (*Journal* August 1, 1936, p 221) he utilized some figures from my work on Bell's palsy to demonstrate his points No criticism was thereby implied of my work as a whole which Dr Mainland has kindly stated seems to be of high practical value (January 23, p 192) Unfortunately the casual reader of the article might have received a contrary impression and it was to make that quite clear that I was impelled to write a somewhat spirited reply In doing so I seem to have turned the tables and quite unwittingly to have given the impression—at any rate to a casual reader—that the methods of analysis which Dr Mainland advocates "are unsuitable for ordinary clinical material" It is only right that I should remove this misconception by assuring Dr Mainland that I was much impressed by his article, which I have studied carefully and accept fully I shall certainly utilize the principles he advocates should the occasion arise in the future

Mr Wells said that he had so far as he knew been the first in this country to record a short series of cases operated upon by the Harris technique He had in the meantime been giving an extended trial to a different type of operation—namely suprapubic diathermy resection of the prostate—but in the past eleven months had returned to the Harris operation he was satisfied that of all the methods so far described it offered the patient the shortest and most comfortable convalescence with the smallest post operative risk For the small fibrous type of gland he preferred the transurethral technique of McCarthy but when in this type there was a large diverticulum it was best to do an open operation remove the diverticulum and then resect the prostate from above by diathermy As was made clear in the film Mr Wells advocated spinal anaesthesia given in the lateral position and carefully controlled by adjusting the level of the spine by means of the kidney bridge In poor risks he favoured an under dose rather than an over-dose and suggested that supplementary anaesthesia with gas and oxygen should be administered A full general without a spinal anaesthetic was contraindicated since the Harris technique prolonged the operation very considerably The film also showed bilateral vaso ligation and by means of the special lighting adopted it had been possible to illustrate quite adequately all the steps by which the prostatic bed was repaired Mr Wells said he now liked to use a transverse incision that it was his practice to test the adequacy of the sutures in the bladder before closing the abdominal wall and that he had recently reverted to the drainage of the space of Retzius

Mr A KIRK WILSON noticed that in the film the haemostatic sutures in the rim of the prostatic cavity were cut short immediately they had been tied He had found that oozing points between the sutures could be controlled if the ends were left long and tied together as described by Harris Mr Wilson favoured a rather longer incision, which would allow the surgeon's hand to pass between the recti muscles and make enucleation possible without contaminating the left hand at the rectum The bimanual enucleation appeared to be a retrograde step from the Thomson Walker operation In his most recent cases he had discontinued complete closure of the bladder A small tube acted as a safety valve and in uncomplicated cases there was no contamination of the wound with urine The tube could be removed on the fourth day and the average time of confinement to bed was not prolonged more than a few days Dr W B BENNETT remarked that the improved technique and shorter convalescence would encourage any sufferer to submit to operation with less apprehension than in comparatively recent years

Mr COSBIE ROSS considered that the secret of success in prostatic surgery lay in the accurate selection of cases for the various procedures available He quoted a recent personal series of 110 cases

Suprapubic prostatectomy	40
Transurethral resection	35
Suprapubic resection	2
Death before operation	6
Conservative measures	16
Refused operation	2
Prostatic enlargement associated with some more serious condition	7

By conservative measures he meant the regulation of fluid intake and output double micturition controlled by occasional examination and estimation of the residual urine and possibly, in some cases the operation of Stemach II Mr Ross disagreed with primary closure of the bladder at the time of the operation Harris himself in his several communications had stated that he regarded the retrigonization of the prostatic cavity as the essential feature of his operation although the primary closure had invariably been the focus of interest He emphasized the dangers of the serious complication known as clot retention when a thick adherent clot spread over the base of the bladder and might occur in spite of the most stringent post operative precautions When it was necessary the same day or the day following the operation to reopen the bladder in order to remove this clot the patient's chances were considerably lessened Mr Ross had the greatest admiration for the retrigonization of the prostatic cavity advocated by Harris, he practised this procedure himself but considered that suction drainage with a water suction pump was a reliable and infinitely safer method of conducting the post operative treatment With this method the abdominal wound was kept relatively dry until healing was far enough advanced for the fistula to be closed by strapping over the wound with elastoplast Another objection to the primary closure of the bladder was the large size of the indwelling catheter required as this was an occasional cause of meatal stricture

THE KIDNEY IN STARVATION

At a pathological meeting of the Liverpool Medical Institution on January 14 with the president Mr G C E SIMPSON in the chair Dr JOHN DUNCAN HAY read a paper on the kidney in starvation

Recent work had proved that fatty changes in livers and hearts were largely, perhaps entirely, the result of infiltration of fat There had been no evidence of phanerosis In view of these findings a series of experiments had been performed upon rabbits in which the effect of starvation upon the kidneys had been investigated The rabbits had been starved for seven days and then killed The kidneys had been examined histologically for fat, and a chemical estimation had also been made of the percentage of fat in them and of its iodine value The kidneys of a control series of unstarved rabbits had been similarly investigated The histological examination in the starved series had demonstrated large amounts of fat in the kidneys mainly in Henle's tubules The fat had been isotropic The chemical percentage of fat had been raised The close relationship between this and the amount of fat seen in the sections proved that the fatty changes were largely due to infiltration An estimation of the degree of adiposity of the animals had been made by weighing the intra abdominal fat deposits The close relationship between the amounts of fat in the kidneys estimated chemically and visually and the degree of adiposity of the animals proved that the amount of fatty change in the kidney in starvation depended on the amount of fat available in the rest of the body for mobilization and transport to the kidneys The results of the iodine value estimations were inconclusive They did not support the conclusions drawn from the other findings, but were not considered seriously to invalidate them

Dr R T CHADWICK remarked that in reference to the observation that fatty infiltration took place in starvation rabbits only when the animals were originally well supplied with fat stores he had noted that the post-mortem examination of the liver and kidneys of children dying from unrelieved pyloric stenosis showed that no trace of fatty infiltration could be found whereas fatty infiltration was very marked in the same places in children dying from unrelieved intestinal obstruction The child in this instance was usually very well nourished

Dr HEWER said that the views about the origin of the fat which appeared in the tissues in fatty change were in accord with necropsy findings in many cases He had recently examined the bodies of two persons dying from uncontrolled haemorrhage one was an obese woman who had had ante partum haemorrhage for four days and the other an emaciated man who had lost blood from a gastric ulcer The organs in the case of the woman (who had abundant fat deposits) were heavily infiltrated with fat while those of the man showed only a trace There was no doubt that at least a high proportion of the visible fat in fatty change was derived by mobilization from the fat deposits

appreciate the value of his opinions He enriched the hospital services of Liverpool as only a sound clinical pathologist could, and it will be as difficult to replace him in the laboratories as in the regard and affection of those who were fortunate enough to be his colleagues and friends

S H HARRIS, F R A C S
Sydney, New South Wales

The announcement of the death of Harry Harris of Sydney, New South Wales, at the early age of 56 will be received with genuine regret by all his friends in Great Britain His name will always be associated with the operation which has revolutionized the results of prostatectomy The first description of his technique appeared in a paper read by him at the Australasian Medical Congress held in Dunedin, New Zealand, on March 26, 1927, but it is only within the last two years that the majority of surgeons have realized the importance of the various steps to overcome the complications and sequelae of prostatectomy which he so strongly advocated Harris's first visit to Europe and this country in 1935 was in the nature of a crusade He was determined to demonstrate the advantages of his technique as often as he was given facilities to do so With tireless energy he travelled from one surgical centre to another, undoubtedly with detriment to his health, although on arrival in England he told me he needed a complete holiday As an operator Harris was a brilliant craftsman, being quick, neat and complete master of his instruments He was also a good speaker His friends will extend their heartfelt sympathy to his widow, his only son, and other members of his family on the irreparable loss which they have sustained With the death of Harris British urology has lost an outstanding personality

CLIFFORD MORSON

W JENKINS OLIVER, B M

An obituary notice of Dr William Jenkins Oliver, who died on January 11, appeared in last week's issue We have received from "J S" the following further note After being educated at Winchester and Oriel College Oxford Oliver proceeded to the London Hospital, where he was in turn clinical assistant in the medical out-patient department and skin and light department and house-physician In the great war he joined the R A M C, and was appointed skin specialist to the troops at Rouen, later being transferred to Germany as adviser in dermatology to the British Army of the Rhine Among other appointments he held were physician to the skin department of the Evelina Children's Hospital the Victoria Hospital for Children, and the Prince of Wales's General Hospital, Tottenham He also studied at Copenhagen and Oslo He relinquished all these appointments in 1929, and then spent more or less half of the year in Norway and Denmark He had a very sound knowledge of skin conditions without being particularly brilliant In London he was a "character" in the best sense of the word He was shy and inclined to be self-conscious, and consequently was never at his best with the adult private patient With children, on the other hand, he was wonderful They adored him and he them I think that one of the happiest times of his life was during his appointment as house-physician at the London Hospital Whenever he entered the children's ward he was received with royal acclamation If you wanted to find "Jinks" you could tell where he was by the din in these wards The illest child would pull itself up in the cot to greet him and in return receive some word of encouragement or joke His care for children and their welfare was the breath of life to him and he soon gained the confidence of the most nervous child Their visits to his clinics was something to which they could look forward, for where he was there could be no fear or need for apprehension, And so this went on all through his life His children's Christmas parties to the pantomime were well known In Norway and Denmark it was the same tale He must have been godfather a dozen times I have seen him there, marching down the road like the Pied Piper of Hamelin followed by scores of children Only this Christmas he had a card from a little Norwegian boy addressed "Dear Olva" His father states it was the same in Cologne Parties of children would wait for his coming and going at the hospital, and run to take him by the hand and joke with him Oliver was an amusing raconteur, read a lot, was fond of pictures, and a keen fisherman Although a fourteen foot salmon rod may have looked unwieldy in his hands, he threw a fly with dexterity and precision And so ends a useful life, far too early it seems (he was 50), and in many homes there will be a blank which can never be filled

Mr ARTHUR WALBANK F R C S Ed, died at Clifton after a brief illness on January 28 at the early age of 38 He was educated at Leeds, where he obtained the M B and Ch B degrees, and after holding resident posts there went to Bristol as house-surgeon to the Bristol Eye Hospital, which appointment he held from 1927 to 1930 After a further period of study he obtained the D O M S of the English Conjoint Board and was admitted a Fellow of the Royal College of Surgeons of Edinburgh and on returning to Bristol he was elected to the honorary staff of the Eye Hospital in 1931 During these few short years as honorary surgeon his whole-hearted co operation in the work of the hospital had endeared him to his colleagues and patients alike He was also secretary to the South Western Ophthalmological Society, and it was mainly due to his unflagging energy that these meetings were always valuable in discussion and cases His keenness and efficiency in his work had already shown him to be an ophthalmic surgeon of great promise and Bristol and the Bristol Eye Hospital are very much the poorer for the loss of Arthur Walbank at such an early stage in his career He leaves a widow and one small son

We regret to announce the death on January 27 of Dr DAVID MCASKIE, one of the most respected and accomplished practitioners in Portsmouth, where he had worked for the past twenty years Previously he had been in practice in London, when he was clinical assistant to the Western Skin Hospital and the x-ray department of the Tottenham Hospital He was at work until a week before his death, but had been in failing health for the past five years Dr H H Warren writes I knew Dr McAskie not only as a successful practitioner but also as an enthusiastic member of the British Medical Association He was a representative of the Portsmouth Division for seven consecutive years, and will be well remembered by many of the present members of the Representative Body, he also took a great interest in the Local Panel Committee and served as honorary secretary to it for many years Dr McAskie was the official medical officer to the Portsmouth Football Club, and his passing is a sad blow to the directors and players, all of whom always affectionately referred to him as "Dr Mac" He had the reputation of patching up in a surprisingly short time those who were occasionally injured and timing them up so that they took the club into the First Division, kept it there, and carried it to the Cup Final at Wembley in 1929 and 1934 During this time they had many injuries and few reserve players so it speaks volumes for the tremendous interest he took in the work Although he had many interests outside his profession, Dr McAskie had a great sense of duty and the care and treatment of his patients always came first [illegible] his obscured a very kindly and tall figure will be sadly missed, especially among the more humble members of the community His helpfulness to his fellow practitioners was exceptional, although in busy

munity who never sought admission to hospital in the past will undoubtedly turn to the Council's hospitals in the future The removal of the repressive taint of the Poor Law and the policy of progressive improvement in every direction in the Council's hospitals have raised the status of the municipal hospitals service so that there is a steadily increasing demand for admission Moreover the constant advance of medical science has necessitated the concentration of expensive equipment in large hospitals because that is the only method of placing adequate means of diagnosis and treatment at the disposal of patients The Hospitals and Medical Service Committee is of opinion that provision should be made in a new scheme for a possible 500 beds The site in South London on which a new hospital could be provided—namely on vacant land within the curtilage of St Benedict's Hospital Tooting—is in the Council's possession It is in the area covered by the metropolitan boroughs of Wandsworth and Battersea at present served by St James's Hospital the section of South London in which there is the most urgent need for additional beds The site would offer adequate grounds for exercise and other amenities In view of the urgency of the matter and the fact that several years must elapse before the premises can be ready for occupation it is considered that immediate steps should be taken to prepare details and estimates of costs

Public Health Notes on Milk

The desirability of instructing health visitors and members of the local health committee has led Dr C M Smith deputy county medical officer for Durham to compile a short memorandum on milk The difference between clean and safe milk is clearly defined and the importance of both these attributes in a public milk supply is duly stressed The danger of drinking raw milk is illustrated by the fact that of 531 cows examined in the county during 1936 no fewer than 44·25 per cent reacted positively to the tuberculin test This incidence of tuberculous infection was reflected in the frequency of tubercle bacilli in the milk supply Of 313 samples of ordinary raw milk exposed for sale during 1935, 4·8 per cent, and of 405 samples of 'accredited' milk examined presumably during 1936 3 per cent were found to contain tubercle bacilli The Durham County education authority recommends that the order of selection of milk supplied under the milk-in schools scheme should be (1) tuberculin tested milk, (2) pasteurized milk having a pre-pasteurization standard of cleanliness equivalent to the accredited standard (3) accredited milk The wisdom of preferring tuberculin tested to pasteurized milk is perhaps open to question

Queen Charlotte's Maternity Hospital

The clinical report of Queen Charlotte's Maternity Hospital for 1935 states that 2 487 patients were treated in the wards this number comprising 2 277 booked cases and 210 emergencies The rates of maternal morbidity were 4·4 and 14·7 per cent respectively the rate for the whole hospital being 5·4 per cent The total number of maternal deaths was nine six of which occurred in emergency cases A short summary is given of the history of each case Of the booked cases one patient died from obstetric shock following manual removal of the placenta and one from acute heart failure following normal delivery in a third case refusal of a post mortem precluded an exact diagnosis, and death was attributed to either mesenteric thrombosis or the perforation of a hollow viscus Summaries are also given of six special cases, including one of hydatidiform degeneration in the placenta and one of double uterus with fibroids causing obstruction There were forty one foetal abnormalities One foetus had webbed fingers and toes another an accessory nipple the mother in this case had eight accessory nipples The list also includes several cases of anencephaly hydrocephalus and spina bifida Of multiple births fifty six cases of twins are recorded and none of triplets One mother aged 41, produced twins weighing respectively 7 lb 7 oz and 8 lb 6 oz. The infant mortality in this series of multiple births was 14·5 per cent

Nomenclature of Mental Hospitals

What used to be known as lunatic asylums have since the passing of the Mental Treatment Act 1930 been officially styled mental hospitals For the purpose of correspondence with the public and for everyday use the Mental Hospitals Committee of the London County Council thinks it expedient that the word mental should cease to be used obtrusively and this omission is therefore proposed from the ordinary designation of the institutions which are still mental hospitals for all statutory purposes The establishment on the Horton estate at Epsom which used to be known as the Ewell Colony and since 1931 has been called Ewell Mental Hospital is in process of being enlarged in such a way as to fit it particularly for the treatment of recoverable cases of mental disorder many of them as voluntary patients A new name is thought desirable for this institution and it is proposed that its ordinary designation should be St Ebba's Hospital

SCOTLAND

New Students' Union at Edinburgh

At a meeting of Edinburgh University Court on January 25 an offer was received from the University Grants Committee of a non recurrent capital grant of £15 000 towards the cost of a students union at the King's Building of the University The new union will be for the use of men and women students attending the science classes and laboratories which are held at the King's Building in West Mains Road and will not affect the present students union in Park Place The total cost of the building exclusive of furnishings is estimated at £20 000, and it will include a refectory and a gymnasium The Court accepted the Grants Committee's offer, which involves the raising from other sources within two years of a sum amounting to at least £7 000 while a further sum for endowment will probably be necessary

At the same meeting various external examiners for degrees were appointed Dr James M Webster lecturer in forensic medicine at Sheffield University was appointed examiner in forensic medicine Dr Webster has also been appointed to take charge of a new forensic science laboratory designed to serve the police forces in the West Midlands of England which is being established in Birmingham by the Home Office Dr Webster who is a native of Perthshire graduated M B Ch B at St Andrews University in 1923 and took the F R C S Ed in 1926 He was previously lecturer in anatomy at the National University of Wales Cardiff

National Scottish Food Policy

Sir John Boyd Orr director of the Rowett Institute for Research in Animal Nutrition at Aberdeen speaking at a meeting in Glasgow on January 26 said that the average health and physique to-day was much better than it was before the war, but it might still be improved if a diet adequate for health was enjoyed by every family There had been much discussion as to what constituted a diet adequate for health In 1935 the League of Nations had appointed an International Committee of Physiologists to define the kind of diet which would contain everything required for health The committee recommended that the diet for a child from 5 to 7 years of age should include one and three quarter pints of milk one egg one ounce of fish meat or cheese four ounces of green vegetables, 8 ounces of potato and other root vegetables and some raw fruit or vegetable This supplied one half of the total amount of food needed daily, and contained all the vitamins minerals and protein that were necessary the other half could be made up from cheaper foods such

among Adults in England—in the Past and in the Future" on February 18 and 23, Dr D E Denny-Brown the Goulstonian Lectures on The Nervous Control of Micturition and its Disorders on February 25, March 2 and 4, Dr Crighton Bramwell the Lumleian Lectures on "The Arterial Pulse in Health and Disease" on March 9 and 11, Dr H Gardiner-Hill the Oliver Sharpey Lectures on Growth and Development and Dr Edwin Bramwell the Croonian Lectures on "Clinical Reflections upon Muscles, Movements, and the Motor Path" on May 25 27 and June 1 All the lectures will be delivered at the College, Pall Mall East, S W, at 5 p m

Membership

The following candidates, having satisfied the Censors' Board were admitted Members of the College

Frank Longstaff Apperly M D Oxf, Bidyn Pati Bhattacharyya, M B Patna, Bernard Roy Bramwell, M D Manch, Francis Staples Brien M B Toronto, John Alfred Brocklebank, M B Lond, George Horace Brookman L R C P, James William Douglas Bull M B Camb, Renfrey Gershon Burnard, M B Adelaide, Archibald Malcolm Gordon Campbell, M B Oxf, Winston Stephen Charters, M B New Zeal, Stephen Thomas Falla, M D Lond, John Ronald Forbes M B Lond, Dorothy Jane Healey, M D Lond, Norman Higgings M D Lond, Norman George Hulbert, M B Camb, Maurice Jacoby, M B Lond, Alan Robert Kelsall, B Chir, Peter James Kerley, M D Dubl, Frederick Basil Kiernander M B Lond, Mary Muriel Lockett M D Lond, William Neville Mann M B Lond, Harry Blight May, M B Camb, Edward Laurence Oliver Murphy, M B N U Irel, Richard Alan Pallister M D Durh, James Alan Price, M D Belf, Alan Boynton Raper M B Leeds, John Clifford Richardson M D Toronto, Leon Eric Rothstadt M D Melb, Chitu Chandra Saha Saha, M B Calcutta, Dominic Victor Sheil M B Melb, Henry James Sinn M B Melb, Alan Herbert Thompson M D Dubl, Aly Fahmy Zanaty M B Cairo

Licences and Diplomas

Licences to practise physic were conferred upon the following 178 candidates (including twenty two women) who had passed the Final Examination in Medicine Surgery, and Midwifery of the Conjoint Board, and have complied with the necessary by laws

K D G Abbott E M Abelson J C Adams A S Aldis, C F S Alken J H Armstrong Mary Barker H M Barnett, I H Blum A M Beemer B Bell A J Beinfield Lily Black, L H Blakelock G W Boden E Bolton E R Bowes Audrey I M Briggs L K Brownrigg J B Bunting G L Burgess, Margaret M Burton M A Carpenter R W Clarke C L Clinton Thomas P R K Coe S M Cornes, H D Croswell, J Dalziel G H Darke P M Davies, H N Davy P C Dhanda W R S Doll I A Donaldson R C Droop G H H, Dunkerton J A Dunlop R W Dunn H J Eistes C H, Edwards B H Ellis J S Ellis J E Ennis L C de R Epps, M M Ernst Mildred G Ernst R G G Evans G R Faber, Mary N Fawcett J G Fife F D M Flowerdew, L Foster, R A Fowler Gwenda M Francis D G Freshwater A R Garner, M N Genena S Gnessen D Graham Brown P H K Gray, W M Gray B J Green T A Hale Monro E H Hambly R P, Harbord W Hargrave Wilson D H Harrison M W Harvey, G Herbert Irene K Hazlet C A St C Hiley Constance M Hill, Emily C Hill W Hobson Margaret J Honeywill C W Horn, castle J Horowitz A M Howard H N G Hudson Gertrude L E Hughes D A Ireland I Isaacs G C A Jackson H, Jackson E M Japha O L Jones A Jordan H S Kandel, Mary Kane S Kaye J G Kee C Kenton J Ketcher C C, Kirby, L M Klusky F D W Knight G S A Knowles D W, Lacey Iris M Lamey R L Lamming J D Laycock J Leiper, J W M Leslie B G A Lilwall C J Longland M Lubran, A D McDonald H A McDonald, W H McDonald N R, McEvoy R McGladdery H McD Mackey Norma M MacLeod, K J Mann G S Midgley, A E Miller Eleanor M Mills, A D, Milne J G Mitchell R H B Mole K W Monks E R, Mountjoy M A H Munshi W M Owen A C D Parsons, H A Pearce G L Pett C Porter K J Powell T C Probyn, S Pruss D P Puri A N Redfern J E Rees H S Resnik, Nancy E G Richardson R B K Rickford A C Ricks, Elizabeth J Rooke H L M Roualle P B L Saltman, A A, Shein A Simpkin G Singh Jandu J Smallpeice C P Smith, E R Smith J A Smith Katharine D Smith G R Steed W A, Steel R Y Stevenson Ethel M Strong R B Taylor R Y, Taylor W H A Thorne H L Thornton G C Tresidder F D, A J N Tsan A G Turner D P van Meurs Daisy C Wallace, Trunx N Warrack G R Waterman Joan M Wenn M H G, White D I Williams G M Woddis R C Wofinden N P, Woodgate Jones M R Woods G Wynn Williams G E Yardley, I H Yates A L Young S S Yudkin

Diplomas in Public Health Psychological Medicine and Laryngology and Otology were conferred jointly with the Royal College of Surgeons The names of the successful candidates were printed in the report of the meeting of the Council of the Royal College of Surgeons published in our issue of January 23 (p 197)

The following diplomas were granted, jointly with the Royal College of Surgeons

DIPLOMA IN TROPICAL MEDICINE AND HYGIENE—R M Abraham, E E Birnett, H B F Dixon, I K El Lamu, W J Pinto, G B Smit, P W Vilam

DIPLOMA IN ANÆSTHETICS—R H Blazeby, C H Catlin G Edwards Eva M Gray Elizabeth M Handfield Jones T A B Harris, T H Hobbes, G H W Kentes Rosalind M P Miln Joyce Morgan, L O Mountford, A H Pirie, J W Redgate J E C Rouse, H B C Sandiford R L Soper, Edith J Thompson, F A H Wilkinson, R F Woolmer

SOCIETY OF APOTHECARIES OF LONDON

The following candidates have passed in the subjects indicated

SURGERY—A Bagon, E E Bullock, F J H D De Marigny, P A Gardiner, F W McKenna, J Meynell, A P Mittra, F L Skinner

MEDICINE—J E R Palmer, W W Willson

FORENSIC MEDICINE—J E R Palmer, W W Willson

MIDWIFERY—A A Beazeley, I W Chapman, R M Coplans, J Meynell, C F Nihill, W G Tillman

The diploma of the Society has been granted to F J H D De Marigny and A P Mittra

CONJOINT BOARD IN SCOTLAND

The following candidates, having passed the requisite examinations have been admitted L R C P Ed, L R C S Ed, L R F P and S Glas

K Aaron, A M Allison, A Blanshaft, A E R Chalmers, S F Cranston, Hester J Davies (*in absentia*) J Drake, A A Esser Philippe Evrenades, E W Finkle (*in absentia*) D G Hanton L B Hardman (*in absentia*) I L Jacobs, W Jones, L Kroll D Lederfeind, M E Lee Abbott Z Leitner (*in absentia*) W J Low, J McGibbon, J MacW MacGregor, M Manelli M Meyer, W B Meyer L Michaelis D B Milne, M N Mitra, K F Nagelschmidt, R Naftalin, H O'Hara, E A Perera, H J Phin, F O Piorkowski, J E Price, K M Regensburger M W Rosenthal A Rumelt M Scholtz, H Sharp, F F Trunx D Varveressos Lena Walker B A MacG Williamson (*in absentia*), H A J Wolff, H Zeller

Medical Notes in Parliament

A memorandum explaining the Government's proposals for the development and extension of the facilities available for physical training was laid on the table of the House of Commons on January 29

Sir John Simon presented, on January 29, the Factories Bill "to consolidate, with amendments, the Factory and Workshop Acts, 1901 to 1929, and other enactments relating to factories and for purposes connected with the purposes aforesaid" The Bill is supported by Mr Elliot

In the House of Commons on February 1 the Unemployment Assistance (Temporary Provisions) (Amendment) Bill was read the third time

The text of the Factories Bill was issued on February 2

On February 2 the Regency Bill and the Public Works Loans Bill were read a second time The Empire Settlement Bill passed through committee

In the House of Lords on the same day the Public Records (Scotland) Bill and the Architects Registration Bill were read a second time The Firearms Bill was read the third time and passed

The Parliamentary Medical Committee met at the House of Commons on February 1 and agreed to accept a recent reply of the Ministry of Health which suggested that representations about ophthalmic and optical benefits as affected by Draft Statutory Rules and Orders, 1926 (National Health Insurance), should be left to the committee to be set up under the new regulations During the discussion an assertion was made that the British Medical Association scheme for sight-testing surgeons would not suffice, as enough surgeons were not available in all parts of the country The Medical Committee also discussed Sir Ernest Graham-Little's Medical Practitioners

followed by a trying period of uncertainty and perhaps after all by an operation Whereas recurrence after radium alone is often an early local recurrence obvious to the patient herself and a cause of pain and disability recurrence after the radical operation plus radium is rarely local It is generally late and the patient lives an ordinary life and is free from pain and from the consciousness of disease until within a short period of the end—I am etc,

London W 1 Feb 1 W SAMPSON HANDLEY

SIR—I have read Mr Cecil Rowntree's excellent paper (*Journal* January 23 p 153) on the treatment of cancer of the breast with considerable interest It is full of common sense and it sums up the present position of therapy in this disease with remarkable judgement It has stimulated me to put forward the following questions

1 Is there any reasonable ground for expecting a cure or any increase of control of cancer if *x* rays of the same wave length as radium are obtainable? Are the results of radium therapy sufficiently satisfactory to justify this assumption?

2 The principle of the short wave therapy— deep x rays —is the delivery of a maximum dose at a predetermined depth Is the method therefore applicable in prophylactic treatment? It must be assumed that malignant cells can be present in any tissue from the skin downwards Deep therapy is not the best form of radiation for treating superficial recurrences The success of low voltage methods such as that devised by Chaoul is proof of this

3 Is the psychological objection to pre operative treatment a really serious one except in the case of a few highly temperamental patients? The possibility of reducing the size and activity of a growth before surgical intervention is surely a matter of the utmost importance

4 Why is it that the importance of preventing the formation of metastases is but seldom mentioned in articles on cancer? In carcinoma of the breast the primary growth but rarely destroys the patient—metastases do all the killing

5 Have we any evidence that suggests that secondary deposits are less frequent after the destruction of the primary growth by x rays or radium than after the removal by operation?

In cancer I consider radium and x rays should be looked upon as palliative agents rather than as a means of cure Too much stress is laid upon the possibility of 'cure'—how can we know what is a cure when the disease may recur after twenty years?—and too little upon relief of symptoms and prolongation of useful life—I am, etc

London W 1, Jan 28 S GILBERT SCOTT

SIR—If anything stated in my lecture on cancer of the breast (*Journal* January 23, p 153) gave the impression that I have found the use of radium unsatisfactory in the treatment of breast cancer I am grateful to Mr Geoffrey Keynes for affording me the opportunity of emphasizing the fact that my disappointment with radium as the method of choice for early carcinoma of the breast is purely relative

One hoped that interstitial radium had provided us with a method of avoiding operation altogether and I shall await with the greatest interest Mr Keynes's promised figures in the hope that his combination of radium and conservative surgery may show improvement in the period of survival without recurrence as compared with the results of radical operation—I am etc,

London W 1 Feb 1 CECIL ROWNTREE

"Rachi-resistance" and Spinal Anaesthesia

SIR—In their article Rachi resistance and Spinal Anaesthesia Dr W R Black and Mr G A Bagot Walters naïvely record that the term rachi resistance has no exact counterpart in the English language, and 'after a thorough search of the available literature we are unable to find a reference to it in the English language

I can assure them that this state of affairs is not due to any lack of knowledge of the ideas put forward many years ago by Sebrechts so that the obvious implication is that the majority of spinal anaesthetists in this country are not convinced that such a condition as he described exists

In the sense in which Sebrechts and the present authors use the term it means a peculiar idiosyncrasy which renders the nerve roots of certain individuals insensitive or resistant to the action of anaesthetic solutions the conception definitely excludes any anatomical or pathological variations which might prevent the solution from reaching the roots in sufficient concentration to produce anaesthesia Everyone has had failures with spinal anaesthesia and as Black and Walters point out, the great majority of these are due to some technical error They fail to realize however that even with a perfect technique there are yet other sources of failure than the assumed idiosyncrasy A few fine adhesions in the arachnoid an unusual arrangement of the dentate ligament the dilated lower end of the theca in cases of spina bifida occulta etc may all nullify the efforts of the anaesthetist without assuming any rachi resistance The conditions I have mentioned all come within my personal experience, there are probably many others to be excluded before we are justified in dragging in an idiosyncrasy as an explanation In my experience of nearly 4 000 spinal anaesthetics I have never felt the need of rachi resistance to explain the very rare failures

The subject is interesting and one might feel tempted to exceed the legitimate length of a letter in argument but I should like to offer some brief criticisms which seem pertinent to me of the cases quoted by Black and Walters

In one of their cases two injections of decicaine produced no anaesthesia and a further injection of percaine had but a minimal effect I should regard this as proof that the failure was due to some anatomical or pathological peculiarity in the theca and not to any idiosyncrasy for it is very unlikely that an individual would exhibit such idiosyncrasy to two anaesthetics as different in their chemical constitution as decicaine and percaine Further a subcutaneous injection of novocain (one would have thought that local percaine or decicaine would have been better suited to their purpose) produced normal local anaesthesia thus proving that in the case of novocain at least the nerve fibres themselves displayed no idiosyncrasy In the other case after an initial failure with 1·5 c.cm of decicaine two further injections were immediately made without effect but once the first injection had for various reasons failed the evidence of the two subsequent injections is of little value for it is common experience that secondary injections are subject to uncertainty if given immediately After the lapse of a day or two another injection will take effect showing that the initial failure cannot be attributed to rachi resistance

I will not occupy space with a discussion of the probable causes of these secondary failures it is clear to my mind that they are not to be explained by any reference to a hypothetical condition of insensitivity or rachi-resistance the existence of which I do not think has been established—I am &c,

London W 1 Jan 30 NORMAN C LAKE

Tuberculosis Deaths

SIR KINGSLEY WOOD on January 28, furnished Mr Rowson with the following tabular statement of deaths from tuberculosis (England and Wales) registered in each of the years 1926 to 1935 inclusive

	Pulmonary	Non-pulmonary
1926	30,108	7,422
1927	31 066	7,114
1928	29,799	6 833
1929	31 425	6 576
1930	29,414	6,336
1931	29,658	6 060
1932	27 627	6 031
1933	27,854	5 405
1934	25,682	5,200
1935	24,603	4 596

On the same date Mr ROWSON asked the Minister of Health to state the total number of deaths from tuberculosis and other causes at Papworth Sanatorium Cambridgeshire, and also in Papworth Village Settlement, during the past seven years SIR KINGSLEY WOOD answered that the authorities of the Cambridgeshire Tuberculosis Colony, Papworth, informed him that the total number of deaths which have occurred in the Colony s hospital during the last seven years was 359, of which twenty eight were deaths of persons transferred from the Village Settlement, and that the number of deaths actually occurring in the Village Settlement during the same period was thirteen He could not state the precise proportion of these deaths which were due to tuberculosis but was making inquiries The Colony received patients in all stages of tuberculosis including advanced cases He was inquiring into an allegation that persons suffering seriously from tuberculosis were employed in factories at Papworth and in some cases so employed until a few days before death

On February 1 Mr ELLIOT, replying to Mr Rowson circulated the following table giving the number of deaths from tuberculosis in Scotland during 1927 to 1936

Year	Pulmonary	Other Forms	Total
1927	3 466	1 402	4 868
1928	3 318	1 404	4 722
1929	3 388	1 292	4 680
1930	3 024	1 262	4 286
1931	3 004	1 201	4 205
1932	2 991	1 132	4 123
1933	2 930	980	3 910
1934	2 794	908	3 702
1935	2 812	834	3 646
1936	2 752	911	3 663
	30 397	11 326	41 705

The Law and Unqualified Practice

On February 1 Sir ERNEST GRAHAM LITTLE asked the Minister of Health whether in view of the claim that an Act (34 and 35 Henry VIII) dealing with herbalists gave to this section of unregistered practitioners the right to engage in medical practice without compliance with the Medical Act 1858 thus defeating the purpose of this Act to enable the public to distinguish between qualified and unqualified practice he would make provision to secure the repeal of this legislation of 400 years ago SIR KINGSLEY WOOD I am advised that the Act of 34 and 35 Henry VIII enabled the persons named therein to treat certain medical conditions without incurring penalties under an earlier Act of the same reign which had given a monopoly of practice to physicians and surgeons approved thereunder by the Bishop, and that it does not give to these persons the rights which are secured by registration under the Medical Act, 1858 The latter Act, however does not prohibit practice by unregistered persons There appears therefore to be no conflict between the two Acts and I do not feel called on to take action in the direction suggested in the question

Advertisements in Books of Stamps

On February 2 Sir NICHOLAS GRATTAN DOYLE asked whether the Postmaster General had received representations from the British Medical Association respecting certain classes of advertisements appearing in the books of stamps issued by the Post Office, and whether he proposed to take action in the matter Sir WALTER WOMERSLEY replied that representations were received from the British Medical Association a few years ago The Postmaster-General recently reviewed the matter in connexion with a question asked by Mr Cary on December 7, 1936, and found no reason for altering the present policy, which was to exclude advertisements and medicines purporting to cure certain diseases specified in paragraph 58 of the report of the Select Committee on Patent Medicines, 1914, but to accept other advertisements whose wording was not objectionable and whose bona fides was not suspect

Midwives Act • Administration

MISS RATHBONE on February 2 asked the Minister of Health if he had taken or would take steps to ensure that all the schemes submitted by local authorities in connexion with the Midwives Act, 1936, should, before being finally adopted, provide for the inclusion of a reasonable number of women members, whether elected or co opted, on the committee or other body entrusted with the detailed administration of the Act Mr R S HUDSON said that local authorities were under a statutory obligation to secure that an adequate service of certified midwives should be available in their areas It was anticipated that the majority of these authorities would entrust the administration of this service to their maternity and child welfare committee There was a statutory requirement that that committee should contain at least two women members

Distribution of Gas Masks—On January 25 Mr LEVY asked the Home Secretary if he could make any statement on the plans for the distribution of gas masks in the event of air attack or threat of such an attack Mr LLOYD said that it was intended, as the accumulation of stocks proceeded, to store the respirators at depots and sub depots throughout the country and distribution to the public will take place from the sub depots in accordance with arrangements which were now under consideration

Registered Blind Persons—On January 25 Mr R S HUDSON replying to Mr Messer, said that on March 31, 1936, there were 67,534 registered blind persons in England and Wales Of these, 22,415 between the ages of 50 and 70 received an old age pension on account of blindness, while 54,675 over the age of 16 were classified as unemployable He had no information on the number of blind persons in receipt of financial assistance from the local authorities

Safety in Mines—On January 26 Captain CROOKSHANK informed Miss Ward that last November there were about forty mines or groups of mines where special safety officers had been appointed additional to the manager and other safety officers required by the law He did not know how many of these safety officers held managers' certificates The arrangements between the owners and the workmen for meeting the cost of the safety helmets now widely used varied He did not know how many companies issued free safety helmets to their men

Free Meals and Milk in Monmouthshire—Mr OLIVER STANLEY in a series of answers to Major Herbert on January 28 said the income scale adopted by the Monmouthshire local education authority for free meals and/or milk was an allowance of 10s for each parent and 5s for each child up to a maximum of £1 Where the family income did not exceed the figures obtained on this basis meals or milk were given free No deduction was made for rent before calculating the income This scale is considerably less liberal than those normally adopted by other authorities On October 1, 1936, the percentages of children on the registers of public elementary schools in the rural and the urban districts of the administrative county of Monmouth for purposes of elementary education who received milk under the milk in schools scheme were twenty six and thirty-six respectively In addition, 9 per cent of the children in the rural districts and 3 per cent of the children in the urban districts received milk (mainly preparations of dried milk) outside the scheme

Metabolic Factor in Rheumatism

SIR—I was interested to read the article by Dr R G Gordon in the *Journal* of December 19 1936 I have always held the view that in rheumatism there is a chronic disturbance of metabolism with incomplete or partial oxidation resulting from alteration in the character and quantity of the blood supply or from nerve exhaustion or strain of any kind These conditions give rise to (*a*) persistent subnormal temperature (*b*) accumulation of acid, (*c*) faulty elimination We have now arrived at what might be called the 'rheumatic state and it can be seen that these metabolic disturbances can arise from both external and internal influences In the former we have chill exposure climatic conditions, and infective factors, and in the latter endocrine and autonomic imbalance, etc These may all coexist or not, they all react on each other, and the final consequences largely depend upon the powers of resistance of the individual

It is not to be assumed from this that rheumatism can be cured by attacking only either or both of these indirect sources and that the matter ends there Far from it It only goes to show in a small way how very much involved the whole subject becomes and closer study convinces one that rheumatism must be regarded as a *symptom* of a disease or group of diseases, the causative factors of which can only be arrived at by a process of exclusion. Treatment must be directed both towards the removal of any discoverable cause and towards the alleviation of its local manifestations the diagnosis and classification of which are complicated It is in the treatment and management of local manifestations that most difficulty arises It is generally admitted that hydrotherapy and physiotherapy are the treatments *par excellence* especially in fibrositis but they can be applied to all forms with beneficial results But how are these to be obtained? It is easy for the comparatively few who live within reasonable distance of spas municipal clinics and other institutions, where these facilities can be had, but what about those who reside far away in towns or countries where these do not exist and who for economic social, and disablement reasons cannot travel and are thus debarred from availing themselves of them? Their fate does not bear thinking about, and their practitioner is not to be envied He is driven to trying every remedy he has heard of He has no place to send his patient

We are told that one sixth of the population is disabled by rheumatism I think the fact that this number has not decreased is due more to lack of specialization and treatment facilities than to lack of knowledge of the essentials of the disease The treatment and management of rheumatism is necessarily a whole time job and should therefore be left to the specialist when he is available It is not enough for him to diagnose and prescribe He should have his own clinic, visiting and residential with his particular choice of treatments concentrated in one centre He can then, with the assistance of nurses, masseuses etc carry on and personally supervise his treatments This has the advantage of being less arduous for the patient and is incidentally, attended with much better results A fortnight or three weeks intensive treatment is the usual period and surely this is better than a jag from the rubber capped bottle once a week for one, two and even three years

As a substitute for the baths used in the various spas there are pyretic and zotofoam baths and these are very easily installed in any private house Pyretic baths are particularly efficacious in all forms of rheumatism and especially in fibrositis It is greatly to be regretted that this treatment has not been better supported by the medical profession for, apart from completing the equipment of the specialist, it is rational in its principle—I am, etc,

Belfast, N I Jan 22 MEA FRAZER.

Angioneurotic Oedema

SIR—Dr David R Hughes's article on this condition and Dr Robert Platt's letter tempt me to say something on this rare condition because the symptoms may be sudden and alarming and, attacking the larynx, may be fatal

This condition interests me because it is related to allergy and, curiously enough I have recently been studying both urticaria and angioneurotic oedema in some aberrant forms of tuberculosis which have been mistaken for rheumatic conditions The truth is that these lesions which may suggest a form of allergy do occur in forms of tuberculosis which can only be recognized as such by the methods which are just beginning to be recognized—the specific tests discovered by Koch himself and used by me ever since Koch's epoch making discovery in 1891—I am etc,

Blood Group Tests in Disputed Paternity

SIR—I read with considerable interest the article by Dr David Harley and Dr G Roche Lynch on the above subject (*Journal* January 23 p 163) as I recently had the privilege of seeing these tests carried out by Dr Hallermann in the Medico Legal Institute of the University of Berlin I am sure that as a result of the increasing publicity given to the subject requests for such tests will sooner or later be made and will tend to become more frequent. While I agree with Dr Harley and Dr Roche Lynch that the fullest encouragement should be given to the use of blood group tests, until statutory powers are obtained to compel submission as a necessary preliminary to any court procedure the number of tests required will probably remain small When the tests are in small numbers and especially when made at infrequent intervals certain difficulties arise

In order to carry out the Berlin method one must have at hand at least two samples of serum from each of the blood groups A and B and similarly two samples of corpuscles from the groups A and B This is necessary as the tests are made by two methods using two different test sera and corpuscles in each—namely, by the test tube method of Schiff and by the drop method on a porcelain tile the surface of which is divided into suitable compartments In the case of the infant blood is collected in a capillary tube and in addition two drops of blood are placed at each end of two microscope slides and allowed to dry When the serum from the infant is insufficient in amount the test is made by the slide method of Lattes using the drops of blood on the slides When large numbers of tests are made each week as in Berlin the constant provision of completely tested sera and corpuscles presents no difficulties sera and corpuscles from each batch of tests are preserved and used as test sera and corpuscles for identifying the classical groups in the following batch Sera for the groups M and N are prepared in Germany for the purpose

When the test is made only infrequently suitable sera and corpuscles may not be readily available When such is the case one may have recourse to members of the staff for the necessary materials presuming, of course that some belong to the blood group B which may not be the case unless the staff is large as the group B is relatively infrequent A more satisfactory method would perhaps be to make a practice of

QUERIES AND ANSWERS

Income Tax

Appointment Cost of Books etc

"CUNCTATOR" holds an appointment in connexion with which he does some teaching which is specially remunerated He has claimed the expense of purchasing books and journals necessary to keep himself abreast of developments but the claim has been refused on the strength of the dicta in the case of Simpson v Tate

*** The stringency of this judicial decision was specifically commented on by the Income Tax Codification Committee which reported a few months ago It seems to us that the inspector is legally correct in refusing 'Cunctator's" claim, but it is obviously a hard case and as the committee in question recommended that 'the extreme rigour of the existing law might be relaxed to meet cases of special hardship, we suggest that our correspondent might write to the Board of Inland Revenue (Somerset House, W C 2) putting the facts to them and asking for special consideration

Sale of Book Debts

"A M S" says A is selling his practice to B, including the book debts Is income tax payable on these debts (1) by B as and when they are paid to him or (2) by A as having received them in the lump sum paid by B to him?

*** They are not assessable on A he has paid tax on his income from the practice, and the amount of the unpaid debts reaches him as capital So far as B is concerned the point will turn on whether or not the gross income of the practice is in future to be measured by 'cash receipts' or by bookings less an estimated amount for loss by bad debts In the former case *all* the cash receipts must be brought in, including those for A's professional services, otherwise the gross earnings of the practice will not be fully shown in the latter case only post-purchase bookings will be brought in and the question will not arise

LETTERS, NOTES, ETC.

Leopold von Schrotter

SIR STCLAIR THOMSON writes In last week's *Journal* the paragraph anent the centenary of this distinguished laryngologist and a revered teacher of mine in Vienna makes mention of his excellent command of English and of his last visit to London in 1901 to attend the Congress of Tuberculosis This reminds me of an amusing little slip he made in his speech at the opening ceremony in the old St James's Hall in Piccadilly It also shows the risks we all run when using a foreign language As delegate of the Austrian Empire Schrotter concluded a fluent address, in remarkably good English, by warmly expressing the hope that the work of the Congress of Tuberculosis "would come up to all our expectorations!"

An Unfortunate Inversion

The minutes of the previous meeting do not often produce humour but one of the principal medical societies in London had its gravity seriously upset the other evening when the honorary secretary produced his minute book The previous meeting had been a pathological one but instead of reading The following showed pathological specimens' he read by an unhappy mischance 'The following pathological specimens were shown," followed by the mere names of a dozen leading physicians and surgeons!

A Medical Paper in Basic English

The article on Hookworm Anaemia by Lieut Colonel Clayton Lane in the *Tropical Diseases Bulletin* for January has the following footnote "The framework of this paper is in Basic English But for some special medical words, most of which are judged by the writer to be international, no words are used other than the 850 words of the everyday Basic List and the hundred words of the General Science List" Readers who would like to know more of the system introduced by Mr C K Ogden director of the Orthological Institute at Cambridge will find what they want in two Psyche Miniature books published by Kegan Paul, Trench, Trubner and Co Ltd, at 2s 6d *The A B C of Basic English* and *Basic English A General Introduction with Rules and Grammar* In brief, the 850 primary words of Basic English have been chosen on scientific principles to form an international auxiliary language—that is, a second language (in science, commerce, and travel)—for all who do not already speak English

Crude Cod-liver Oil

Dr N PINES (London E 1) writes Crude cod liver oil has attracted some attention in the profession lately I have been injecting intramuscularly for the last few years 1 to 2 c.cm at a time, with very beneficial effect If some local anaesthetic is added it is well tolerated and helps to increase the general resistance of the body

Margarine with Vitamins

The technical staff of Unilever Ltd have prepared a pamphlet entitled 'What is Margarine?" describing in it the methods of adding vitamins so as to make margarine of comparable food value to butter Copies of the pamphlet may be obtained from Van den Berghs and Jurgens Ltd, Unilever House, Blackfriars, E C 4

A Guide to the B P Addendum

When the *British Pharmacopoeia* was issued in 1932 British Drug Houses Ltd published a guide drawing attention to many important innovations This firm has now prepared a pamphlet of twelve pages entitled *The B D H Guide to the Addendum 1936 to the B P 1932* Copies of this will be sent to any members of the medical profession who apply to British Drug Houses Ltd, Graham Street, City Road N 1

Disclaimers

Dr J S HORSLEY (Dorset Mental Hospital, Dorchester) writes I should appreciate the courtesy of your columns to disclaim any responsibility for the undesirable publicity which has been given to my work on the use of intravenous barbiturates for narco analysis

We are asked to insert the following disclaimer in connexion with the mention of a member's name in the last issue This member had occasion to order an oxygen tent to be sent by air to Switzerland No communication was made to the Press, either directly or indirectly Presumably the address on the instrument was read by a journalist at Croydon and their foreign correspondent added further information The name of the patient happily was incorrect

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR,—A patient was recently admitted to the Southport Infirmary under my care as a case of appendicitis.

She had a history of acute pain in the abdomen of sudden onset with collapse and vomiting. She was unmarried aged 27 and had only menstruated three times very slightly. She presented symptoms and signs suggestive of haemorrhage rather than of peritonitis and a pre-operative diagnosis of pelvic haemorrhage was made. On opening the abdomen it was found that she was bleeding steadily from the left ovary apparently from a ruptured Graafian follicle. There were calcified glands all over the abdomen the uterus was infantile the tubes and ovaries were normally formed and the appendix was kinked but not inflamed. The left ovary and appendix were removed. On section the ovary showed a normal Graafian follicle with no suggestion of decidual cells or anything suggestive of an ovarian pregnancy. Convalescence has been smooth.

I have ventured to report this case as I imagine that rupture of a normal Graafian follicle is an unusual cause of symptoms suggesting an acute abdomen.—I am, etc.,

Thyroid Extract for the Itching of Jaundice

SIR,—With reference to Professor Murray Lyon's article on Thyroid Extract in Conditions Other than Myxoedema in the *British Medical Journal* of January 23, may I add that Sir Walter Langdon Brown found the use of thyroid extract useful in the treatment of jaundice with pruritus. The administration of thyroid extract diminished the output of bile and relieved the itching.—I am, etc.,

P. N. BARDHAN

London, W.10 Jan. 25

*** We have referred this letter to Sir Walter Langdon-Brown who writes: Gilbert and Herscher had observed the benefit of thyroid extract for the itching of jaundice, and stated that it did diminish the formation of bile salts. I proceeded to investigate both in patients and in animals the output of bile salts both before and after giving thyroid and confirmed the observation that the output of bile salts was actually diminished. I then used it clinically, with decided success in some cases.

Acquired Haemophilia

SIR,—Can such a condition as acquired haemophilia be recognized? If not, what is the explanation of the unusual case which is here briefly described?

An Englishman aged 41, an architect by profession, had been under the care of Dr. W. Wilkinson for some years. His appendix had been removed in 1927 for chronic appendicitis.

Since 1932 he had complained of headaches, indigestion and abdominal discomfort. In 1935 he received treatment with emetine and colonic lavage on account of an enlarged liver and chronic colitis. This was followed by a course of an autogenous mixed coliform vaccine, vatren tablets and stovarsol. *In February 1936 he noticed a return of the* abdominal pain and flatulence. Sigmoidoscopy showed the large bowel to be inflamed and tender, no ulcers were present. He was given colonic lavage and vatren enemata. His tonsils at this time were enlarged and inflamed. After treatment he felt better for some months but in November he again complained of sore throats and lassitude.

Tonsillectomy was considered advisable to remove a cause of chronic septic absorption and he was referred to me for an opinion. I found the tonsils enlarged with crypts containing the usual septic detritus. I performed tonsillectomy at 12 noon on December 5, 1936, under endotracheal anaesthesia by Dr. J. A. Carman using a Boyle-Davis gag. The tonsils were not unduly adherent and the patient left the theatre with dry tonsillar fossae. It was apparently a perfectly straightforward case. A little later the ward sister found that he was vomiting and coughing up a considerable amount of blood. From then onwards the sequence of events was as follows. At 3 p.m. the tonsillar fossae were cleared out and packed with adrenaline gauze. At 5 p.m. an anaesthetic was administered by Dr. G. Drury through a Boyle-Davis gag and the fossae were cleared of very friable clot. General oozing was found to be taking place on both sides but no definite bleeding points were visible. Gauze packs were placed in the fossae and the pillars of the fauces were sutured together with three stitches on each side.

From then onwards the patient was given in succession morphine (repeated) intravenous calcium chloride intramuscular haemoplastin and foreign whole blood into the buttocks. At 11 p.m. one and a half pints of normal compatible blood were transfused from a healthy subject. Nothing however was of any avail the bleeding continued and the patient died at 4.30 a.m. Meanwhile the incision in the arm where the blood transfusion had been given also oozed without ceasing.

What is the explanation of this case? There was no family or person history of haemophilia (operation performed without untoward effect in 1927). Was it due to lack of blood platelets, and if so, why? Would any further treatment have been of any avail—for example ligature of the carotids or cauterization of the fossae? I should be grateful for comments.—I am, etc.,

European Hospital, Nairobi Jan. 4

Glycosuria

SIR,—In reply to Dr. Vatcher's criticism (January 30, p. 244) of my letter in your issue of January 23 I would explain that I used the word in the sense of sugar in urine. Lactosuria is described under the heading puerperal glycosuria in the *Encyclopaedia of Medicine* published by Green and Sons (1907).

My first impression of the case I mentioned was that it was a case of diabetes and that the breast trouble was secondary but as the sugar disappeared as soon as the breast condition cleared up I came to the conclusion that the breast condition was primary and the glycosuria secondary.—I am, etc.,

R. ANDERSON

Birmingham, Feb. 1

Gas Gangrene

SIR,—The three following cases of gas gangrene appear worthy of report in view of the uncommonness of the condition and the usual grave prognosis.

Case I.—This was a case of compound fracture of the right tibia and fibula following a street accident admitted on June 8, 1936, the wound was small. The damaged tissues were excised and anti-tetanus serum, *1,000 units* and anti-gas gangrene serum 10,000 units were given the same evening, and the following evening anti-gas serum alone. Three days later the skin showed bluish mottling and the limb was swollen and had a curious odour. Later in the day crackling could be felt, and x-rays showed gas. Amputation through the upper third of the thigh was performed. Further doses of serum were given for four days and although there was a little sepsis the man was discharged fit and well on July 22, 1936.

Case II.—This was a compound fracture of both tibia and fibula following a street accident on December 3, 1936, but

patients coming more or less directly into contact with cattle Of the eight patients not occupied in farming, only one had a family history of tuberculosis An examination of the herds with which the twenty-five patients had been more or less in direct contact showed that tuberculosis was demonstrable in four of them, and in certain other herds all the cattle were not above suspicion Practically all the patients had drunk raw milk, but there was only one among the thirty-three found to be suffering from tuberculosis of the intestines In this case the intestinal disease was secondary to the pulmonary disease The clinical picture did not differ in any essential point from that presented by pulmonary disease caused by the human type of tubercle bacillus Nor did it seem that the prognosis was affected by the type of the bacillus

Surgery

98 Splenectomy for Haemolytic Jaundice

R GREGOIRE (*Presse méd* December 2, 1936, p 1953) considers that neither medical treatment nor radiotherapy is of any lasting value in cases of haemolytic jaundice, and that surgery offers the only hope of permanent cure, splenectomy being the operation of choice The disease is primarily one of youth, and is often seen in quite young children It is suggested that it may be overlooked in the case of children, and that many minor disorders may really be early signs of the disease, which only shows definite symptoms with adolescence These may consist of cardiac disorders, ocular lesions, retardation of growth, and genital development, in view of these conditions operation is advised as soon as a diagnosis has been made There do not appear to be any contraindications to splenectomy, which has given remarkably good results, especially in young children In the case of older patients medical treatment in mild cases will not cure the disease but will render life quite possible, and operation is not indicated in these cases Jaundice alone is not sufficient indication for operation, but progressive anaemia is a dangerous symptom and stones in the urinary bladder or gall-bladder often make surgical intervention a necessity This should not be carried out until medical treatment and blood transfusion have increased the red corpuscles to at least 2,500 000 Blood transfusion must be carried out with care in these cases In seventeen personal cases the results of splenectomy have been entirely satisfactory, with no mortality Emphasis is laid on the advantage of early intervention before other complications have developed The operative risks are slight

99 End-results of Phrenicectomy

R COURTOIS and J LECLERCQ (*Scalpel* Liége, December 5 1936 p 2441) give the results seen in a series of 129 cases in which phrenicectomy had been carried out Two different series are given—immediate results after operation and end results after a period of from one to six years In every case there was evidence of active tuberculous disease, and phrenicectomy was not carried out until artificial pneumothorax had proved unsuccessful In some cases phrenicectomy was complementary to oleothorax drainage, costectomy, or pneumothorax, but in the majority of cases it was the only procedure The most satisfactory immediate results were obtained in those cases in which the disease was of recent and slow development and limited to one side only When the lesion was bilateral and with rapid extension phrenicectomy was disappointing and often only caused some amelioration of symptoms It was seen when comparing the immediate with the late results, that those cases which did well after operation usually continued satisfactorily several years after while those patients who were only improved often showed continued recovery and at the worst were able to withstand any increase in the disease Those patients who derived no immediate benefit from operation did not improve later In certain rare instances, of which two cases are described, recovery took place some time after operation, although the immediate results had not appeared to be favourable Attention is drawn to the disappointing end-results often seen in cases treated by a combined pneumothorax and phrenicectomy It is urged that sanatorium treatment is very necessary as an adjunct to operation, and it is of particular importance in those cases which are liable to recurrence

100 Osteoporosis Circumscripta Cranii

C VAN DER HEIDE (*Nederl Tijdschr Geneesk*, December 12, 1936, p 5555) records a case of this complaint, otherwise known as Schuller's disease in a woman aged 48, suffering from a paranoid hallucinatory condition of an organic character Apart from the skull changes no skeletal abnormalities were found except in the right ilium, which showed an irregular and coarse structure resembling Paget's disease, with which Schuller's disease is probably connected This condition must be distinguished from Schuller-Christian's disease and von Recklinghausen's osteitis fibrosa cystica

101 Gonococcal Bursitis

L STROMINGER (*J Urol Méd Chir*, October, 1936, p 341) states that lesions of the peri-articular serous bursae are relatively common during an attack of gonorrhoea They may be associated with gonococcal arthritis or peri-arthritis, and are usually localized round the joints or at the site of some injury They have been called peri-articular hygromas, and are most commonly found in the flexor or extensor surfaces of the wrist or foot or round the hip-joint near the trochanter The bursae which give most trouble are those found in the sole, and they often make walking painful and may turn the patient into a complete invalid Diagnosis is usually easy, although the condition has sometimes been mistaken for tuberculosis, syphilis, or traumatic arthritis This type of bursitis is resistant to treatment and liable to recurrence Radiology is of little use in diagnosis except in cases of involvement of the os calcis when there is evidence of atypical exostosis Involvement of these bursae in the sole only occurs in acute cases, usually in men, and never in women or children, and it is thought that trauma in the course of work may be a contributory cause Treatment must be of a medical nature and must aim at curing the discharge and its genital complications unless suppuration is present, when operation will be necessary

Therapeutics

102 Veronal Poisoning

G SACK (*Dtsch med Wschr*, December 18 1936, p 2082) reports from the University Hospital in Freiburg observations on the treatment of poisoning by the veronal group of drugs He distinguishes between slight and severe cases, the treatment of which differs in certain important principles In a mild case stimulants such as caffeine may be used, whereas in a severe case there is a limit beyond which the pushing of a stimulant defeats its own object Even large intravenous injections of a stimulant in a severe case of veronal poisoning may prove futile and it is now necessary not only to combat failure of the respiratory and cardiovascular systems, but also that of the renal system In the experience of the author the third day in a severe case of veronal poisoning is usually the turning point, the fate of the patient hanging on the behaviour of the kidneys During the first two days there is as a rule some excretion of urine, and it is only on the third day that anuria is apt to set in This is the more significant as about 70 to 90 per cent of the drug is excreted by the urine, a comparative small quantity being decomposed in the body The dilution of the urine

I trust all differences between us are now removed and I am sure Dr Mainland will not object to my saying that the very simplicity of the standard deviation test may constitute a danger in that clinicians unversed in statistical methods may easily misapply it The danger is possibly that valuable clinical work might be discarded rather than the converse It is unfortunate that so many questions in biology can only be approached from the statistical point of view May I quote Hogben

Instead of relying on a statistical estimate about where a correct measurement *may* lie the scientist proceeds to devise a more accurate method which will enable him to define narrower limits within which it *must* lie

The surgeon can rarely devise these crucial experiments nevertheless by following the hints given by statistics he proceeds to collect cases in which Nature has experimented Pathology thus supplies the extra support on which he builds his working hypothesis This is the procedure adopted in my own work and I take it, is what Dr Mainland is referring to when he says

the standard deviation test discusses the extent to which chance acting alone in a certain set of conditions could account for the result found in an actual sample It ceases when it has answered the question put to it leaving the observer to decide whether for him chance could sufficiently account for the result or whether some other factor was likely to be responsible

"A Medical History of Liverpool"

SIR—Whilst I am extremely grateful to you for your review of this book a review which is generous not only in its praise but also in its length, I would like to draw attention to an omission which is of considerable importance The book has been edited by Mr H R Bickerton and myself and unfortunately the impression is created by your reviewer that I am the sole editor

In order that no injustice may be done I should like it to be known that Mr H R Bickerton has borne more than his share of the editorial work He devoted more time to the preparation of the book than I did and it is he who is chiefly responsible for the publication of the work—I am etc,

Liverpool Jan 30 R M B MACKENNA

*** We much regret the inadvertent omission of Mr H Richard Bickerton's name as joint editor with Dr MacKenna—ED, *B M J*

An article on the relation of industry and education in the February issue of the *Human Factor*, issued by the National Institute of Industrial Psychology (Aldwych House, W C 2) says that the good general education of the past which was sufficient for instance to enable a boy or girl to enter an office is now generally inadequate On their side business men and their personnel managers have frequently installed selection tests and they frequently make wider use of psychological methods than do the educationists themselves Industrial psychology is now busy on both sides of the gap that separates education and industry at the recruiting stage The Vocational Guidance Section of the National Institute of Industrial Psychology is assisting in an important research and scheme of training in Birmingham the scope of which is now being widened to include the testing of all new entrants into junior technical and commercial schools'

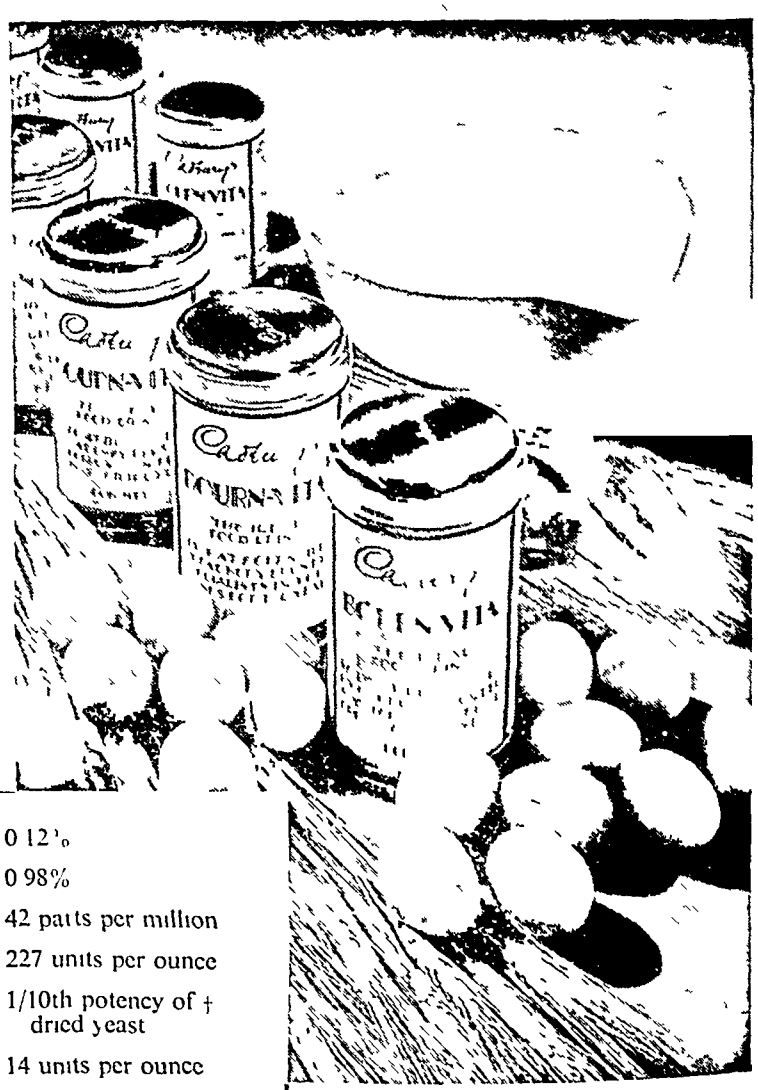
Obituary

H A OSBORN D M

Group Pathologist Liverpool City Council Hospitals

Dr Henry Alexander Osborn died on January 23 His untimely death from septicaemia at the age of 43 has cut short a career of great value to the medical profession and importance to the city of Liverpool where he was engaged as pathologist to a group of city hospitals

Born at Ladysmith in August 1893 Osborn had a brilliant career at Natal University College Following upon Army service in the East African campaign he entered New College Oxford, in 1917 with a Rhodes Scholarship From there in 1919 he gained an open entrance scholarship in pathology and pharmacology to King's College Medical School In 1921 he qualified M R C S, L R C P and graduated B M, B Ch in 1922 going on to the D P H in the following year In 1935 he obtained the D M of Oxford having submitted a thesis on pemphigus neonatorum After graduation Dr Osborn acted for a time as second casualty officer at King's College Hospital In 1923–4 he was resident assistant clinical pathologist there, and during this period on account of his great reliability, won the esteem of all with whom he came in contact Thereafter for some years he was engaged in private consultant practice and later acted as pathologist to the Wembley and Ealing Hospitals In 1931 he was appointed group pathologist to the Liverpool city council hospitals a post which he held at the time of his death He established a pathological service at Mill Road Infirmary Alder Hey Hospital and Smithdown Road Hospital and these group laboratories undertook the work provided by 3 000 hospital beds As a result of his work at the Mill Road Infirmary he wrote jointly with Dr H Carter a paper on neo-natal dermatitis which attracted considerable attention when it was published in the *British Medical Journal* of March 7 1936 He had been a member of the British Medical Association for some ten years and was a Fellow of the Royal Society of Medicine and of the Liverpool Medical Institute In July 1924 he married Dr Muriel M Harris, who had been a student at King's Possessed of an almost untiring energy and of an infinite capacity for patient research, his death will be a great loss to the hospital services of Liverpool and a personal one to all his colleagues



A colleague writes

Dr Osborn's early death brings a brilliant career to an end Liverpool was fortunate when in 1932 he was appointed to establish pathological departments at three city hospitals and the efficiency of the present pathological service is the best index of his ability enthusiasm and industry Despite the heavy pressure of routine work he spent his leisure in research and made several contributions to medical literature He recently published important papers on Neo natal Dermatitis and The Age Factor in Lobar Pneumonia For a considerable time he had been interested in the causes of stillbirths and neo natal deaths and had collected a great deal of evidence relating to these and allied subjects Dr Osborn was quiet kind and unassuming He was a man of few words and preferred silence to small talk but his judgement was so sound that his colleagues always took their prob'ems to him It was never his practice to hand out fulsome praise and he preferred the more difficult and helpful task of offering educative criticism To know him well was to

Here are FOUR PROTECTIVE FOODS IN ONE

The high 'protective' food value of *Bourn-vita* makes it an addition of the highest importance to the diet of ordinary people, especially in winter The table below ★ shows this value in exact terms Bourn-Vita gains its 'protective' qualities not from synthetic additions but from its wholesome constituents — new-laid eggs barley malt, fresh full-cream milk and cocoa

An increasing number of doctors, basing their recommendations on *Bourn-vita's* declared contents, the experience of their patients and Cadbury's reputation, are advising its use in suitable cases where mineral and vitamin deficiency may exist, or where a soothing night-cap of high digestive qualities may prove valuable

★

Calcium (as CaO)	0 12%

practice himself he was never too busy to lend a hand to a colleague without thought of fee or reward His passing will be keenly felt by a large circle of friends and patients and the sympathy of all is extended to his widow, son, and two daughters

We regret to record the death of Dr THOMAS EDWARD WHITE of Streatham S.W. on January 18 at the age of 79. Dr White qualified in 1876 as L.R.C.S.I. and in the following year he was admitted L.R.C.P.I. He then held the posts of clinical clerk at the Richmond Whitworth and Hardwicke Hospitals Dublin physician to the Dublin Small-pox Hospital and house surgeon to the Huddersfield Infirmary. In 1894 he obtained the D.P.H. of the English Conjoint Board and in 1896 the degree of M.D. at the University of Durham. Before his retirement he was surgeon to the P. Division of the Metropolitan Police and a divisional surgeon of the Metropolitan Water Board. He was a lecturer and examiner in ambulance and nursing work for the London County Council lecturer and examiner for the British Red Cross Society and medical officer of the Forest Hill Provident Dispensary. Dr White acted as representative at the Annual Representative Meetings of the British Medical Association in 1921, 1923, 1925 and 1926 and he was chairman of the Lewisham Division in 1922–3.

Dr ARTHUR WARD COLLINS who died at Ulverston on January 22 at the age of 77, received his medical education at the University College and the Royal Infirmary, Liverpool, gaining a Holt Scholarship in anatomy at University College, Liverpool. He qualified M.R.C.S., L.R.C.P. in 1884 and two years later took the degrees of M.B., Ch.B. at the Victoria University with honours in anatomy, materia medica and pharmacology. In 1897 he received the D.P.H. conferred jointly by the Royal Colleges of Physicians and Surgeons of Edinburgh. Dr. Collins held the post of house surgeon and anaesthetist at the Royal Infirmary, Liverpool, and after setting up practice in Ulverston became medical officer to the local Poor Law Institution. He had been a member of the British Medical Association for forty-three years. In 1905 he served as president of the old North Lancashire and South Westmorland Branch and he was chairman of the Furness Division in 1926–7.

We regret to learn of the death of Dr GEORGE WARWICK BAMPFYLDE DANIELL at Grahamstown, South Africa, on January 19. He received his medical education at St George's Hospital and qualified M.R.C.S., L.R.C.P. in 1888. He was at one time lecturer on anaesthetics in the Cape University and was honorary anaesthetist to the New Somerset Hospital. Dr. Daniell's contributions to medical literature include a description of an apparatus for warmed ether vapour published in the *Lancet* in 1923, and an article on "The Use of Nitrous Oxide and Oxygen with Rebreathing as a General Surgical Anaesthetic" printed in the *South African Medical Record* in 1924. He joined the British Medical Association in 1892. He acted as representative at the Annual Representative Meeting of the Association held at Portsmouth in 1923 and on the occasion of the Centenary Meeting in 1932 he held the office of vice-president of the Section of Anaesthetics.

We regret to record the death of Dr FARQUHAR MACKENZIE MATHESON of Harrow on January 21 at the age of 63. Dr. Matheson took the degree of B.A. at the University of Cambridge in 1900 and then came to London to receive his medical education at University College. He qualified M.R.C.S., L.R.C.P. in 1903. Dr. Matheson had been a member of the British Medical Association for twenty-seven years, and was chairman of the Harrow Division in 1927–8.

Universities and Colleges

UNIVERSITY OF OXFORD

Nuffield Professorships

Of the four new medical professorships created under Lord Nuffield's benefaction two have now been filled.

Mr. Hugh Cairns, M.B., B.S.Adelaide, F.R.C.S., of Balliol College, is appointed to the Nuffield Professorship of Surgery as from January 27. Mr. Cairns is surgeon to the neurological department of the London Hospital and surgeon to the National Hospital, Queen Square. He was the author of the Study of Intracranial Surgery published as a special report by the Medical Research Council in 1929. Temporary arrangements have been made for his work in Oxford to be limited to certain administrative duties, enabling him meanwhile to continue his other work in London.

Mr. Robert Reynolds Macintosh, F.R.C.S.Ed., anaesthetist to the Throat Hospital, Golden Square, and anaesthetist and lecturer in anaesthetics at the National Dental Hospital, is appointed to the Nuffield Professorship of Anaesthetics as from February 1.

UNIVERSITY OF CAMBRIDGE

The Faculty Board of Medicine has submitted a report to the University in which it recommends the abolition of the thesis for the M.B. degree. Reference to these proposals will be found at page 278. The report will be discussed in the Senate on February 9.

UNIVERSITY OF LONDON

Philip Geoffrey Scott, B.Chir., F.R.C.S., of Jesus College, Cambridge, and St. Bartholomew's Hospital, has been appointed to the Geoffrey E. Duveen Travelling Studentship in Oto-rhino-laryngology for the year 1937.

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN

The following post-graduate scholarships will be awarded:

(*a*) A. M. Bird Scholarship of a value of £200 for one year to enable a medical graduate to obtain general experience in pathology.

(*b*) Mabel Webb and A. M. Bird Research Scholarship of a value of £200 a year for assistance in carrying on research.

(*c*) Dr. Edith Pechey Phipson Scholarship of a value of £95 a year, preferably to graduates coming from or going to work in India.

These scholarships are open to women only. Candidates for (*a*) and (*b*) must be former students of the medical school. Further particulars can be obtained on application to the Warden and Secretary of the School, Hunter Street, Brunswick Square, W.C.1.

ROYAL COLLEGE OF PHYSICIANS OF LONDON

At a Comitia of the Royal College of Physicians of London held on January 28 with the President, Viscount Dawson of Penn, in the chair, it was decided to present an Address of Loyalty to His Majesty King George the Sixth on his accession.

The College approved the election of its President as a Vice-President of the Imperial Cancer Research Fund. Dr. E. Mapother was elected a Councillor in the place of the late Professor E. H. Kettle. The President announced the publication of the report on Domestic Heating by Gas considered from the point of view of Health and Comfort by an Advisory Committee appointed by the College.

Appointment of Representatives

The following were appointed delegates of the College: Viscount Dawson of Penn to the Centenary Celebrations of the University of Durham, July 1 to 3; Dr. H. P. Newsholme to the Health Congress of the Royal Sanitary Institute at Birmingham, July 12 to 17; Lord Horder to the Annual Congress of the Royal Institute of Public Health at Margate, May 25 to 29; and Dr. H. C. Cameron to the Seventh English-Speaking Conference on Maternity and Child Welfare to be held in London, June 1 to 3.

Lectures

Dr. P. M. D'Arcy Hart will deliver the Milroy Lectures on "Measures for the Prevention of Pulmonary Tuberculosis"

Mr Cartland proposes on February 10, to move a resolution on the trend of population and Mr Keeling to move on the same day a resolution on civil protection against air raids

Import Duty on Liver Products

In the House of Commons on January 25 the Beef and Veal Customs Duties Bill was considered in committee On the question that Clause 1 stand part of the Bill Sir REGINALD CLARRY said that under Subsection (2 *b*) sweetbreads were exempted from duty They were exempted primarily because they were essential to the medical preparation of insulin for diabetes Liver products were also necessary to manufacturing pharmaceutical chemists in the production of remedies for pernicious anaemia They were not exempted from the Bill and the Government ought to consider at a later stage inserting that exemption The additional cost entailed by this Bill would make the cost of the medicine equivalent to 3½d a week per person At present the raw materials for these remedies were imported from South America Only 20 per cent came from the Dominions and a British product was not available What he was asking was not a large matter The quantity under discussion amounted to about 800 tons per annum of an approximate value of £36 000 so that the Treasury would not lose a great deal but they would certainly help to maintain an essential remedy at a lower price to the public if they were able to make this concession

Sir FRANCIS FREMANTLE said that pernicious anaemia was a disease that might attack anybody That being so they would be very glad to have the remedy in question It was exactly comparable with sweetbreads which was a matter on which the Medical Committee of the House of Commons had taken action in approaching the Chancellor of the Exchequer and Ministers for some years past and exactly the same considerations arose in regard to liver products Therefore these required similar treatment and he hoped the matter would receive the sympathetic consideration of the Government

Captain EVAN WALLACE said it was impossible to trace the progress of liver after it came into this country Sir Reginald Clarry had suggested that the tax which was to be imposed would cost a person suffering from pernicious anaemia an extra 3½d a week That statement could only be accepted with reserve While about half the quantity of sweetbreads imported were used for the manufacture of insulin—and it was admitted that insulin had been given an entirely unique position in regard to duty—the annual imports of liver amounted to £500 000 not to £36 000 as mentioned by Sir Reginald Clarry

Sir REGINALD CLARRY said he only referred to the quantity used for this purpose

Captain WALLACE said that of the quantity imported only 5 per cent so far as they were able to trace was used for medicinal purposes The medicines into which this 5 per cent of liver was manufactured were used for the cure of pernicious anaemia It would of course be open to the people who got their liver in this country to apply to the Import Duties Advisory Committee if they felt that they were being done down To deprive the Exchequer of the revenue on imported liver whose total annual value was something like £500 000 for the sake of 5 per cent of the liver would be to strike another blow at the general scheme of duties by which the Government set such store

Sir REGINALD CLARRY emphasized that it was only the 5 per cent used in the production of this remedy which he desired to be exempted The remaining 95 per cent would therefore be subject to duty

Captain WALLACE said he had endeavoured to show the impossibility of identifying this particular 5 per cent If Sir Reginald Clarry could suggest any means of segregating the 5 per cent the Financial Secretary to the Treasury would be prepared to consider it

Mr A V ALEXANDER asked if Captain Wallace would arrange for a drawback on liver used for the production of medicinal preparations by the pharmaceutical chemist That would be simple

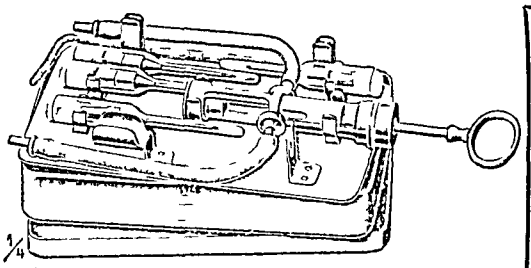
Captain WALLACE said it was not so simple as Mr Alexander thought He would not like to tie himself down on a matter of this kind but the Government had a very open mind on this question If a means were found of identifying this liver easily and simply without undue administrative complications or undue financial implications the Government would be prepared to do what they could to meet this point

The clause was agreed to by 158 votes to 91 Sir Francis Fremantle Dr Leech and Dr Morris Jones voting with the majority

The Bill passed through committee and was reported without amendment to the House

Empire Settlement and Population at Home

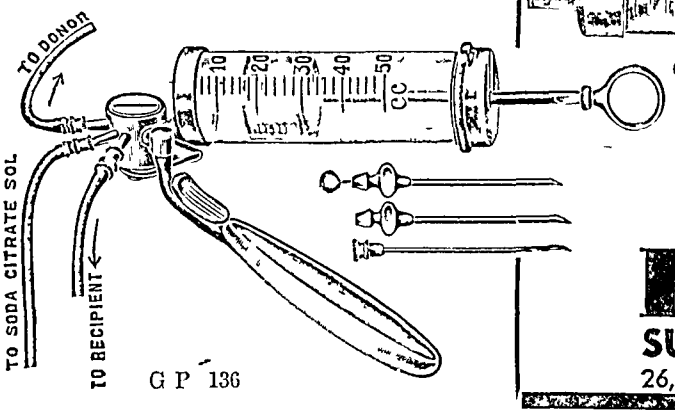
On January 25 Mr MALCOLM MACDONALD in the House of Commons moved the second reading of the Empire Settlement Bill He said that the existing Empire Settlement Act would come to an end on the last day of next May The Government proposed to extend the Act for another fifteen years and to fix £1 500 000 as the maximum sum which the Government could spend on migration schemes in any one year In considering migration Parliament must keep its eyes on those figures which indicated the population trend figures which prophesied that in a few years time the total population of this country would begin to decline and that the total of the unemployed people in this country would decline still further



Mr LUNN in moving the rejection of the Bill said he was opposed to child migration being restarted Mr MARKHAM said that the Registrar General's review for 1935 showed that from 1947 onwards the nation would have actually a declining population At the rate of the figures given in that review they would see by 1947 a population declining so seriously that by 1960 there would be only 24 000 000 or 25 000 000 people in these islands The whole trend of the policy of birth control or family limitation was getting more and more severe The nation might find it was at the head of a great Empire but itself had a population under 30 000 000 opposed by ever growing numbers in Eastern European countries and other foreign countries That was an argument for shutting down emigration in the near future and for saying that no longer should we allow this country to be weakened by sending oversea not its less desirable members but some of the best

Mr MACDONALD replying to the debate said that the question of boarding out young children with families in the Dominions did not arise on the Bill There was no proposal that that particular scheme should be started again

The Bill was read a second time by 193 votes to 87



Ophthalmic Benefit

In a reply on January 28 to Mr Edward Williams Sir KINGSLEY WOOD said the representations from the Institute of Chemist Opticians and other pharmacists as regards national health insurance ophthalmic and optical benefits in draft Statutory Rules and Order 1936 No [illegible] would be brought to the notice of the Approved Committee to be set up under the new regulations This committee was to include representatives of approved societies and organizations of opticians among them the Institute of Chemist Opticians The committee would determine the qualifications which would entitle opticians to inclusion in a list of those to be recognized for the purposes of ophthalmic benefit

Duty on Prescribed Spirits—On February 1 Lieut Colonel COLVILLE informed Mr Hall Caine that the Chancellor of the Exchequer could not see his way to initiate legislation to grant a rebate of duty on spirits supplied solely on doctors prescriptions

Physical Training Organizers—Mr SHAKESPEARE states that 170 local education authorities have appointed one or more whole time or part time organizers of physical training and a number of other authorities are considering making such appointments The number of organizers now employed by local education authorities is 275

Special Training and Nourishment of Recruits—On February 2 Mr BELLENGER asked whether the Secretary of State for War could make a statement on the experiment of special training and nourishment for certain selected recruits under standard Mr DUFF COOPER replied that at the end of an initial three months training thirty one of the thirty three recruits who had been selected for experiment were adjudged to be fit to start the normal recruits course and were passed to their regimental depots for this purpose Twenty four had since been passed as up to standard while seven who had not reached normal standard but had made such progress as to justify their retention were under special observation at their depots The experiment was regarded as successful and its practical application on a larger scale was under consideration

Doncaster Scarlet Fever Outbreak—The additional cost to the rates due to the recent outbreak of scarlet fever caused by infected milk is estimated at £365 in the borough of Doncaster and £70 in Doncaster Rural District

Notes in Brief

The Government has undertaken to bear the whole cost of accumulating the main items of anti gas equipment which would be required to implement local schemes and to make contributions towards the cost of additional hospital equipment and fire fighting appliances required to meet emergency conditions

Arrangements are being made for a limited number of officers in the larger Government Departments to undergo an instructional course at the Civilian Anti Gas School at Falfield

The rates of maternal mortality per 1 000 births for 1934 1935 and 1936 were in the case of Edinburgh 5 3 5 3 and 5 5 and in the case of Glasgow 6 7 and 5 9 The 1936 rates are provisional

Provisions of the Public Health Acts do not at present apply to Government offices but Section 341 of the Public Health Act 1936 which comes into operation on October 1 will enable the corresponding provisions of that Act to be applied to Crown property by agreement between the appropriate Government Department and the local authority concerned

Medical News

H R H the Duke of Gloucester has accepted the invitation to become president of the British Empire Cancer Campaign King George VI when Duke of York was president of the Campaign from 1924 until his accession

Viscount Dawson of Penn will open the new deep x-ray therapy and radiological department of the Samaritan Free Hospital for Women Marylebone Road N W on Friday February 12 at 4 p m Other speakers will include Sir Ewen Maclean and Dr Oxford

An address entitled The Modern Gospel of Unreason ' will be given by Professor W G de Burgh before the British Institute of Philosophy on February 16 at 8 15 p m at University College Gower Street W C 1 Cards of admission may be obtained from the Director of Studies University Hall, 14, Gordon Square W C 1

The notifications of influenzal pneumonia for the week ending January 30 in London were 211 as compared with 327 for the previous week and the number of deaths from influenza was 154 as compared with 273 The number of deaths ascribed to influenza for 122 great towns in England and Wales (including London) was 1 155 for the week ending January 30 The corresponding figure for the previous week was 1 137 and for the week before that 1 109

A meeting of the Chelsea Clinical Society will be held at the Hotel Rembrandt Thurloe Place S W on Tuesday February 16 at 8 30 p m when Sir Harold Gillies will open a discussion on Plastic Surgery Treated patients together with a cinematograph film will be shown The meeting will be preceded by dinner at 7 30 p m

A meeting of the Royal Sanitary Institute will be held in the Town Hall, Halifax on February 12 at 4 45 p m when there will be discussions on milk and dairies legislation and housing past present and future Visits will be made to the water purification plant the new flats for working class women the disinfestation plant and the new isolation hospital where a short address on The Future of the Isolation Hospital will be given by Dr G C F Roe

A meeting of the Listerian Society of King's College Hospital will be held in the large lecture theatre of the hospital on Wednesday February 10 at 8 30 p m when Dr Alan Gregg medical secretary of the Rockefeller Foundation will give an address on Psychological Research

At the meeting of the Pharmaceutical Society of Great Britain at 17 Bloomsbury Square W C on Tuesday February 9 at 8 30 p m Dr C H Hampshire secretary to the Pharmacopoeia Commission will give a lecture on The Addendum 1936 to the *British Pharmacopoeia* 1932

94 Sedimentation Test in General Paralysis

K H Tremming and J Madsen (*Hospitalstidende* October 27 1936 p 1137) find that though the treatment of general paralysis with malaria is the best at present available the complications may be so serious that a search must be made to eliminate them by tests of prognostic value The activation of a latent pulmonary tuberculosis or bronchopneumonia might be avoided were malaria treatment to be withheld because some test gave clear warning The authors are inclined to think that the rate of sedimentation of the erythrocytes may serve this purpose and they have applied the sedimentation test to fifty three recent cases of cerebro spinal syphilis the diagnosis being dementia paralytica in most of them Only in 20 per cent was the sedimentation test normal and in about 50 per cent it was definitely raised In only three cases were intercurrent diseases found which could account for the high sedimentation rate It was slow in all the six cases in which there were no psychic manifestations, although the morbid changes in the cerebro spinal fluid were well marked The authors conclude that a slow sedimentation rate combined with marked changes in the cerebro spinal fluid is indicative of a comparatively superficial form of cerebral syphilis and is to be interpreted as a sign of good omen A slow sedimentation rate in a case with only slight cerebro spinal fluid changes but well defined psychic manifestations is indicative of a stationary condition of some duration the prospect of a remission of the disease in response to malaria treatment is poor When the sedimentation rate is high and the changes in the cerebro spinal fluid are slight some other morbid process than syphilis of the central nervous system should be sought There is no contraindication to malaria treatment in a high sedimentation rate if it is not due to some intercurrent disease There seems to be some connexion between the sedimentation rate and the globulin content of the cerebro spinal fluid

95 Erythema Nodosum

E Tornell (*Nord med Tidskr* November 14 1936 p 1865) gives an account of an outbreak of erythema nodosum which he traced to the consumption of milk infected with tubercle bacilli of the bovine type The epidemic began in January, 1935 with a single case Five new cases occurred in June six in July, and one in August All thirteen cases were observed in a textile factory in Sweden and the ages of the patients, all females ranged from 17 to 29 years In ten cases the erythema developed at the same time as or with an interval of one to three weeks after a sore throat This sore throat ran a comparatively mild course, although in some cases enlargement of the glands behind the angle of the lower jaw persisted for several months In six cases the joints were involved The sedimentation rate was normal only in three cases whereas in the remainder it was considerably raised All the tuberculin tests were positive but in as many as eleven cases the radiological examination of the chest was normal In one case the first radiologically demonstrable infiltrations were followed by the development of pleurisy and in another case slight hilus changes were found While the author has hitherto succeeded in tracing three outbreaks of erythema nodosum to open cases of human tuberculosis he could not in the present outbreak find any such source of infection This outbreak was however evidently of a tuberculous character as all the patients were tuberculin positive whereas in the author's surroundings some 20 to 25 per cent of the inhabitants at the age of 20 are still tuberculin negative He found that all thirteen patients had been supplied with milk from the same source and when rabbits and guinea pigs were inoculated with this milk the tubercle bacilli found in the lesions they developed conformed to the characters of tubercle bacilli of the bovine type

96 Pre operative Electrocardiographic and Radiological Examination

J Foged and T Geill (*Hospitalstidende* November 10 1936, p 1177, and November 17 1936 p 1205) claim that a considerable reduction could be effected in post operative deaths if patients undergoing major operations were systematically subjected to electrocardiographic and radiological examinations of the heart In the seven year period 1928–35 there were 634 post operative deaths in their hospital, the cause of death in ninety seven of these cases (15 per cent of the total) being heart failure judged by clinical and post mortem evidence The heart disease had been detected clinically in only forty three of these cases In other words the clinical examination failed in most cases to give the necessary warning of a potentially flagging heart before the operation The authors have accordingly submitted to electrocardiographic and radiological examinations 428 patients admitted for some major operation Among them were 353 patients who came to operation after a clinical examination had shown nothing amiss with the heart In 253 of these cases the electrocardiographic and radiological examinations confirmed the normal clinical findings In the remaining 100 cases the clinical verdict of a normal heart was challenged either by the electrocardiographic or by the radiological examination or by both The post operative cardiac mortality in the group of 253 cases (276 operations) was 1 1 per cent while it was 11 8 per cent in the group of 100 cases (110 operations) in which the clinical evidence of a sound heart was not confirmed by the other examinations The heart diseases playing the most important part in post operative deaths would seem to be coronary sclerosis and degeneration of the myocardium When these conditions are demonstrable they should be considered as serious contraindications to a major operation if this is not absolutely indicated Such a question would arise as a rule among elderly over weight patients suffering from such ailments as gastric and duodenal ulcer disease of the gall bladder fibromyoma prolapse of the uterus large hernias appendicitis and cancer of the stomach colon rectum and uterus

97 Bovine Type Pulmonary Tuberculosis

P Mourier (*Ugeskr Laeg* October 29 1936 p 1018) has sent to the State Serum Institute in Copenhagen for type determination sputum gastric contents and pleural effusions from his sanatorium in the period 1932–6 Among 161 unselected patients thus examined there were 128 found to harbour tubercle bacilli of the human type and thirty three (20 5 per cent) tubercle bacilli of the bovine type It was noteworthy that most of the patients in the author's sanatorium were recruited from rural areas and were associated in some way or other with farming The ages of most of the thirty three patients were between 15 and 30 years there were only two patients over this age According to K A Jensen only 2 per cent of the cases of tuberculosis in Copenhagen can be traced to bovine infections The difference between the frequency of bovine infections in town and country is therefore considerable Among the thirty-three were twenty five

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name, by such means the Bank succeeds in combining domestic tradition with business efficiency A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch or at the branch situated in B M A House, Tavistock Square, W C 1

by diuretics may indeed reduce the concentration of veronal in it but the sum total of the drug thus excreted is raised Evidently the anuria of veronal poisoning is connected with an inadequate intake of fluids and to repair this the author gives from 2 to 4 litres a day of Ringer's solution by subcutaneous injection In most cases the response twelve hours after this treatment was a profuse excretion of urine and the patient was safely tided over the critical anuria

103 Liver Therapy

E HAMMERSCHLAG (*Ars Medici* July 1936 p 291) analyses the various effects of liver therapy One of the principal factors is the detoxicating effect of liver extracts But the liver also stores the various important substances formed in the different parts of the alimentary tract These substances have an anti allergic function and a detoxicating effect on histamine *The liver further stores* the water soluble vitamins and certain substances which act on the blood vessels Variations in the therapeutic effect of the liver preparations are due to their methods of manufacture The author hopes that in time the different components of the liver extract will be isolated and clinically and biologically defined The polyvalence of the liver extract explains its often favourable action on allergic conditions such as asthma and hay fever various intestinal disturbances sea sickness various toxic anaemias *certain skin affections such as* hydroa vacciniformis, and finally in Bechtereff's disease

Anaesthesia

104 Spinal Anaesthesia 200 Cases

WESLEY BOURNE and P E O SHAUGHNESSY (*Canad med Ass J* November, 1936, p 536) report favourably on 200 cases of intrathecal nerve root block ('spinal anaesthesia') by the Etherington Wilson technique in which the height of analgesia is controlled by the timed rise of the hypobaric Howard Jones solution of percaine 1 in 1 500 injected at the third lumbar space in the upright position The original dosage for low medium and high analgesia was *10, 12 or 15 c.cm with the patient* kept upright for twenty five, thirty five and forty five seconds respectively The authors' dosage has been heavy, 40 per cent of their cases having had 15 c.cm, 40 per cent less and 20 per cent more than this, three cases had 20 c.cm Sufficient narcotics were given to make the patients drowsy and amnesic morphine, scopolamine and nembutal being used in various combinations Half the cases had stimulants usually ephedrine, the authors recommend the intravenous route Nausea occurred in 35 per cent of cases circulatory depression in 13 per cent headache in 7 per cent There was one severe collapse with respiratory arrest for half an hour, but ultimate recovery follow ing nembutal 3 grammes scopolamine 1/100 gramme and percaine 15 c.cm with the patient upright for thirty seconds One case had incontinence of urine for twelve days In five cases analgesia was incomplete The authors conclude that care must be taken with dosage and the length of the spine taken into account They agree with Etherington Wilson that better results might be obtained with smaller doses retained upright for longer periods

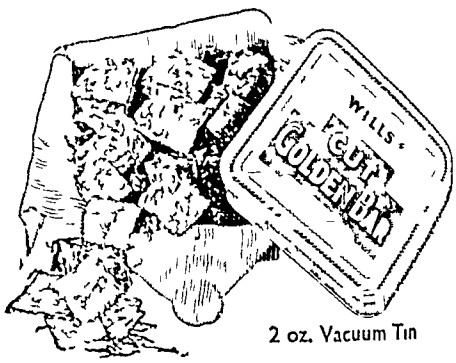
105 *Experience with Evipan*

H E BLOMQUIST (*Nord med Tidskr* November 28 1936 p 1946) calculates that over two million ampoules of evipan have already been sold and that some 550 original articles have been written about it Sodium evipan anaesthesia was introduced at his hospital in Wasa in March 1933 *and up to March 1936* evipan anaesthesia had been induced in 529 cases, in 365 of which evipan was the only anaesthetic used In the remaining cases it was used as a preliminary to or as an associate with some other anaesthetic local or general The evipan was as a rule injected into a vein of one arm at the rate of 1 c.cm every fifteen seconds for the first 4 c.cm The rate was then raised to 1 c.cm every ten seconds No ill effects followed the not infrequent deposit of some of the anaesthetic by mistake outside a vein The amount needed to induce anaesthesia varied greatly some patients requiring only 2 c.cm to fall asleep others from 6 to 7 c.cm The dosage had therefore to be determined by the needs of the individual, not by any rule of thumb Most of the patients were again wide awake half an hour after the completion of the operation and could eat and drink without discomfort The elderly and debilitated patients who were liable to go on sleeping a long time were awakened by an injection of coramine The evipan was given in ninety out patient cases the patients being able to walk home an hour or two after regaining consciousness Post operative restlessness was observed in five cases in all of which comparatively large doses of evipan had been given Four patients vomited after recovering consciousness but in two of these cases the evipan could not be held responsible for the vomiting There were no anaesthetic deaths in this series and no case in which the evipan failed to induce sleep The ages of the patients ranged from 10 to 83 years The author's opinion of this anaesthetic is favourable, and he stresses *its importance* as a means of diminishing pulmonary and other complications of general anaesthesia But he is inclined to be cautious when the liver or kidneys are defective as evipan is broken down in the liver and its constituent elements are excreted by the kidneys

106 Vinyl Ether Anaesthesia

E W BEACH (*Curr Res Anesth* September–October 1936 p 214) records his observations on anaesthesia with vinyl ether (vinesthene) in 2 630 cases during the past two and a half years He considers that its characteristics —namely rapid induction and recovery with no irritation of the air passages and few after-effects—render it particularly suitable for minor surgery in ambulant cases and notably for dental extractions in children It may be used with advantage wherever a deep anaesthesia of short duration is required and for providing increased relaxation with gas–oxygen *but its great volatility* and rapidity may make long anaesthesia difficult and necessitate close watchfulness and attention *Its rapid* and brief analgesia are of value in midwifery and deep anaesthesia may also be safely obtained here if required but caution is necessary in long administration owing to the possibility of toxic effects upon the liver

107 Cyclopropane Anaesthesia



J B BOGAN (*Curr Res Anesth* November–December 1936 p 275) has given cyclopropane anaesthesia to 315 unselected patients for various operations of which 120 were appendicectomies and *112 were other major pro*cedures The patients were aged from 5 to 84 years 145 had cyclopropane–oxygen alone, sixty nine had ether as well and 101 had preliminary avertin they had the usual preparation generally including morphine about an hour before operation The Waters carbon dioxide absorption technique was used in nearly all cases and is recommended for economy and reduction of explosion risk The usual proportion of gases was 15 per cent cyclopropane to 85 per cent oxygen The author advises beginners to practise *this technique* with familiar agents and to be prepared to change to ether if necessary He recommends caution in administration particularly the avoidance of high concentrations which may cause cardiac irregularity In this series there were no anaesthetic deaths and post-operative complications were no greater than those following nitrous oxide or ethylene In over half the cases the blood pressure rose from 10 to 20 mm Hg during the anaesthesia while the pulse rate slowed

ASSISTANTS—MANY VACANCIES IN TOWN and country. Indoor and Outdoor. List on application.

A Matter of Opinion

Some motorists say that the starter battery should not be under the bonnet, where it suffers from the heat of the engine Others say that the only alternative position—under the floorboards—is so inaccessible that the battery gets neglected We say that wherever you put it, it will become discharged—quickly so in winter—unless some steps are taken to supplement the dynamo Trickle charging at night is the most convenient way of doing this The Westric folder will explain the importance of the battery and will tell you where the Westric scores Send for your copy now

COMFORT IN BED *for* rheumatic *and* neuritic cases, *the* chronic invalid, *and the* aged

Those who have recently made the acquaintance of 'Viyella' Sheets are warm in their praise From many parts of the country come letters telling of the comfort 'Viyella' Sheets have brought to sufferers from rheumatic complaints, to chronic invalids, the aged, and others who dread the chill of linen or cotton sheets Many members of the Medical Profession have shown their confidence in 'Viyella' Sheets by recommending them to their patients, and have even gone so far as to write personal letters endorsing the claims that have been made Now, when the resistance of those who suffer from chronic illness is lower, the 'kindly comfort and sweet relief' of 'Viyella' Sheets will be doubly welcome

NATURAL WARMTH AND SOOTHING COMFORT

'Viyella' Sheets have the smooth touch of linen but the warm feel of wool They are porous and light as down, being made of a scientific blending of purest lambswool which radiates heat, absorbs perspiration, and is absolutely non irritant They bring the *natural* warmth and soothing comfort which induces sleep

If you have not already received detailed particulars of 'Viyella' Sheets we shall be pleased to send these, together with samples of the fabric Inquiries should be addressed to William Hollins & Co Ltd (Medical Inquiries), Viyella House, Nottingham

* EXTRACT FROM THE 'PRACTITIONER' *

Most practitioners have patients—sufferers from rheumatism, neuritis, sciatica, nephritis, pneumonia, etc—whom they know would be much better off sleeping between blankets, but the patients frequently dislike the irritation and the weight of the blankets In view of this, we have been asked to make a test of 'Viyella' Sheets, as being the happy medium between the heavy blanket and the cold sheet There was no suggestion of weight or irritation, and there was an unusual cosiness in getting into bed between 'Viyella' Sheets The feeling of soothing and comfort which ensued ought to do good to invalids and convalescents

An excellent tonic after Influenza

COLLIRON

(Evans)

Colloidal Ferric Hydroxide with traces of Copper

Colliron is readily assimilated and gives, therefore, a prompt tonic effect in

DEBILITY and FATIGUE

Being non-constipating it is the ideal form of iron for women and children. As it is highly concentrated a small dosage suffices for average conditions.

Five minims of Colliron contains the same amount of iron as a Blauds Pill

In 4 fld oz bottles 3/- each In 16 fld oz bottles 9/6 each
„ 8 „ „ „ 5/- „ „ 8) „ „ „ 40/- „

Prepared at Evans Biological Institute by

Evans Sons Lescher & Webb Ltd.

LIVERPOOL and LONDON

This pure, unsweetened Dole Pineapple Juice packed in vacuum-sealed tins is

HIGH IN NUTRITIONAL CONTENT

YOU can always count on unvarying quality and goodness in Dole Hawaiian Pineapple Juice And the exclusive Dole Fast-Seal Vacuum-Packing Process preserves to a high degree the *desirable fresh-fruit constituents* As a result, whenever your patients open a tin of Dole Hawaiian Pineapple Juice they are greeted by a tropical aroma, by a tangy flavour of juice that is unvaryingly delicious

The original Hawaiian pineapple juice, Dole juice, has received the Seal of Acceptance of the American Medical Association's Committee on Foods It not only contains important fresh fruit elements, but is a natural source of vitamins A, B, and C

J K Husband & Co , Ltd , 10 Eastcheap, London, E C 3

PREPARING FOR A LUAU NATIVE FEAST—There are lots of preparations to be made before the luau is ready to be served The poi must be pounded, the pig cooked in the imu—underground oven, pineapples, bananas and other fruits are gathered, squid and fish must be caught on the reef, and the ti leaves gathered from the mountain side in which to wrap the food and also to serve as covering for the table

To the happy Hawaiian there is almost as much pleasure in all these preparations as in partaking of the delicious feast

Here is a typical analysis of Dole Pineapple Juice

Moisture	85 3%
Ash	0 4
Fat (ether extract)	0 3
Protein (N x 6 25)	0 02
Crude fibre	0 9
Titratable acidity as citric acid	1 4
Reducing sugars as invert sugar	
Carbohydrates other than sugars (by difference)	0 38

P.S. If you will drop us a line on your letter head we will be glad to send you a free sample tin of Dole Hawaiian Pineapple Juice, the perfected pineapple juice

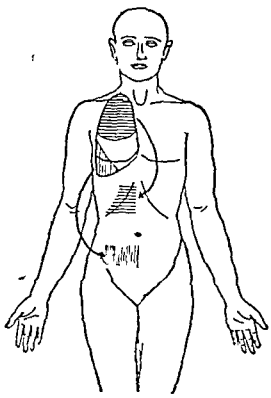
A NEW BOOK

MAJOR'S PHYSICAL DIAGNOSIS



JUST ISSUED

Pain in gall bladder disease

This entirely new book was planned and written by DR RALPH H MAJOR to meet the needs of both medical student and practitioner The book is complete, covering both the normal and the abnormal It is based on 15 years' experience, adheres precisely to the *four cardinal methods of physical examination,* and covers the entire body from the head to the extremities

Dr Major stresses the fact that physical signs are produced by physical causes and that these underlying causes must be first thoroughly understood before an attempt at diagnosis be made He quotes throughout from *original sources* He paints the historical background of signs and physical symptoms He explains clearly the principles of the four cardinal methods of examination He tells *how* to use them, how to *interpret* the signs which they elicit

Projection of pain to abdomen in pneumonia

There is an unusually instructive chapter on *Pain,* and another on *History-Taking and Recording* There are *427 illustrations* (both photographs and drawings) which were chosen and included here to aid in a full comprehension of the significance of the methods and of the diagnostic findings discussed *The author's well-known interesting* style is evident throughout the book

The CONFIDENCE of the Medical Profession

Benger's Food has gained its great reputation by the constant recommendation of Medical Practitioners

By its unique self-digestive action Benger's Food scientifically adjusts fresh cow's milk, diluted or undiluted, to suit the individual needs of a patient In this respect it is different from any other Food obtainable

Benger's is largely used as a routine treatment in all cases of impaired digestion The following comments, recently made, indicate some of the specific conditions for which the Medical Profession prescribes Benger's Food

DYSPEPSIA.

"routine food in all cases of dyspepsia and disordered digestion"

"used for invalids and all gastric cases"

INFLUENZA

"very largely used for Influenza in all its forms"

CANCER

"invaluable for cancer of the throat"

"cancer of the stomach — doing well on Benger's Food"

THE AGED

"very beneficial for man of greatly advanced years"

"invariably used for invalids & aged persons."

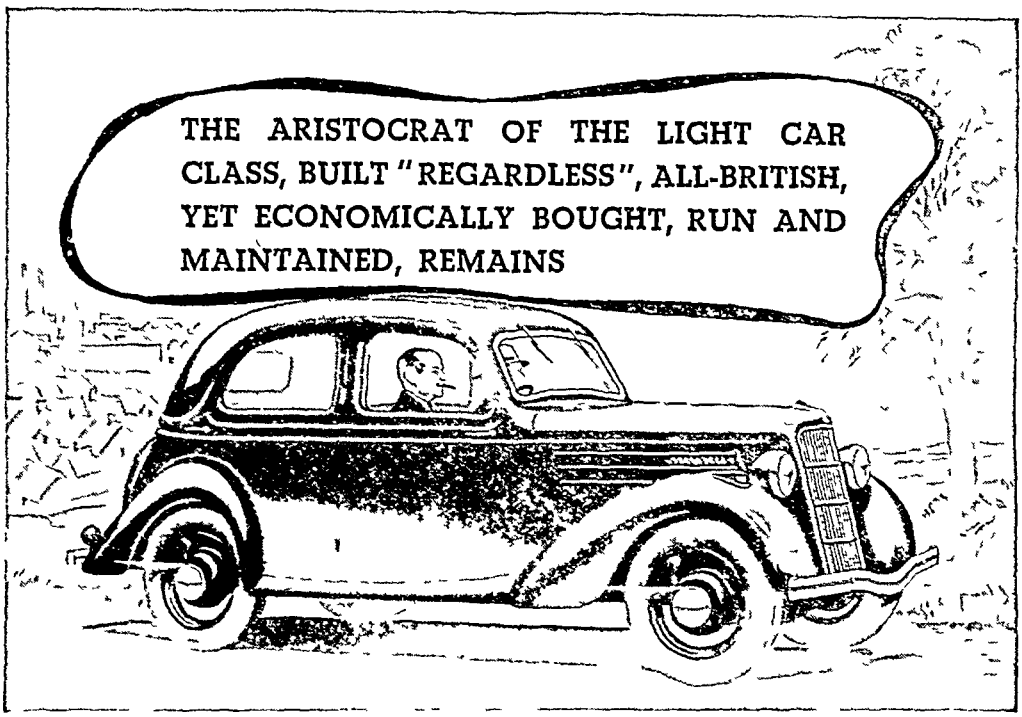
Nutrition

In these days when the free provision of milk to school-children is being advocated as a preventive of malnutrition, the need to provide Energy as well as Body-building Elements, should not be overlooked



In this connection these words of two dietitians might be borne in mind —

> *"It is in carbohydrate that milk is specially deficient Hence it should be used chiefly in conjunction with other foods rich in that ingredient SUCH A FOOD IS BREAD"*

"FOOD and the PRINCIPLES of DIETETICS"—Hutchison and Mottram.

BREAD for ENERGY

Saloon £135 Touring Car £135 Double-Entrance Saloon £145 Leather Upholstery & Sliding Roof (on Saloons) £10 Extra

THE DE LUXE FORD (£7 10s Tax)

In comfortable roominess, surprising performance, nicety of equipment and finish, ease of handling under any conditions, adequacy of brakes, all-round justification of pride of ownership, it is an exemplary production in its taxation class, and would be a sound bargain at considerably more than its price

Every day it is replacing costlier, heavier cars, with absolutely no penalty in convenience or satisfaction—furnishing really luxurious motoring at an expenditure hitherto undreamed

And it looks the thoroughbred that scientific design, matchless materials, and unique manufacturing resources, at Dagenham, have made it! *Let the local Ford Dealer prove all this, to the hilt*

A step in the right direction

New Cocoa process means improved nutrition for the masses

THE desirability of increasing the nutritional value of the diet of the masses is too obvious to need emphasis here Because it achieves this end without adding one penny to the cost of meals, we believe the new predigestion process now used in making Rowntree's Cocoa will be of real interest to every medical man

This new predigestion process makes for improved nutrition in two ways —

1 The buffering power of Rowntree's Cocoa is increased by 10%—and consequently its role in the digestive process is increased accordingly It now makes even milk three times as digestible The increase in digestibility is particularly noticeable with the enzyme erepsin, making this improved cocoa particularly beneficial to children Practically no indigestible protein now passes into the large intestine, thus bacterial decomposition and the accumulation of poisonous substances in this region is avoided

2. The protein in Rowntree's Cocoa is now more digestible than that in other cocoas This means that it actually builds more bone and muscle than other cocoas—again a factor of particular value in the case of children

★ ★ ★

This improvement in Rowntree's Cocoa has been made without altering the delicious flavour in any way The price is also unchanged

'VARIBAN' ELASTIC PLASTER BANDAGE

VARIBAN' BANDAGE constitutes a marked advance on the older methods of treating chronic ulceration of the leg It is made from a specially woven selvedge material possessing highly elastic properties and is impregnated with an antiseptic zinc oxide paste

VARIBAN is self-adhesive and combines the principles of firm equable pressure and support to the swollen leg with the benefit of an occlusive dressing under which the ulcer is protected and is stimulated to healthy repair

In promoting proper circulation VARIBAN steadily reduces oedema It provides protection to the granulations of the healing ulcer In the majority of cases it is found that pain is either eliminated or greatly relieved from the first application The necessity for ointments lotions etc is obviated while VARIBAN provides an ambulatory treatment which allows of full activity of the limbs with better results than the following rest in bed alone

MIL-SAN

The Scientific Contraceptive

. . . its non-toxic character

It is taken as an essential by the producers of MIL SAN that a contraceptive which members of the medical profession can prescribe with confidence and the public use with safety must be non toxic

There must be no danger of toxic disturbance by absorption even over a long period of use Likewise, it must not contain any ingredient which would be unsafe if it fell into the hands of children or persons ignorant of its purpose

This automatically rules out arsenical, mercurial and quinine compounds and derivatives The gynaecologists who conducted the researches and tests were familiar with cases of toxic disturbances caused by these ingredients, while instances were known of fatalities due to the accidental misuse of poisonous compounds

MIL-SAN contains no poison and can occasion no toxic disturbance Its contents are set out in the literature sent on request to all interested members of the medical profession

MIL-SAN is non injurious, is immediately effective, independent of temperature, moisture or foaming, and is simple and hygienic to use In manufacture, packing and application, there is no contact with metal, thus all contamination with metallic salts is avoided

The MIL SAN method of application by means of ready filled, single application tubes is simple, ensures the quantity, maintains hygienic conditions and is proof against carelessness

Specimen tubes are sent to members of the medical profession on request

OVALTINE

IN NUTRITIONAL CRISES

WHILE the average adult is able to maintain a healthy existence on the ordinary everyday diet there are certain periods in the life of each individual when an increased demand for the vital food elements arises Outstanding examples are the period of adolescence the pregnant and nursing states and the stage of convalescence after severe and lowering illnesses

Ovaltine is an eminently satisfactory adjunct to the ordinary dietary at all such times Composed of fresh full cream milk eggs and malt extract in proportions adjusted to meet physiological requirements it provides in an agreeable form calcium, phosphorus vitamins and other important food elements

Ovaltine is a metabolic stimulant and digestive which assists the assimilation of other foods and promotes general good health It can therefore be taken regularly with advantage in place of tea coffee or other beverages A noteworthy feature is its delightful taste which is appreciated by people of all ages

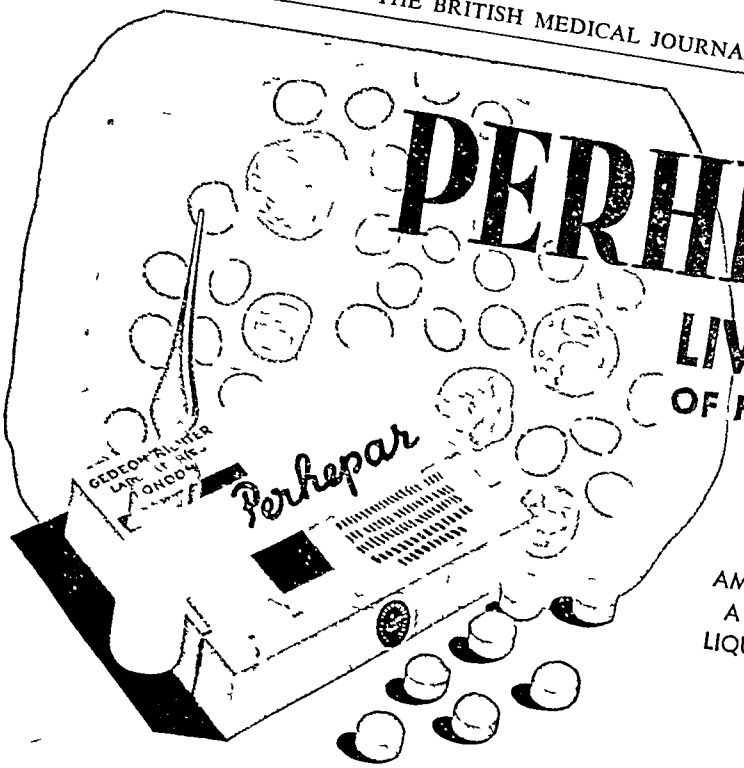
The depletion of bodily reserves associated with Epidemics

INFLUENZA, Measles and Whooping-cough, are specially dangerous on account of the high attendant risk of pulmonary sequelæ, such as pneumonic and tuberculous invasions

Such complications can be largely prevented by maintaining the weight and the vitality of the patient with readily assimilable nutriment, both during illness and in convalescence

The value of Virol during an epidemic period (Feb 21—May 15, 1935) is conclusively demonstrated by the following abstract of a recent investigation* into the supplementary feeding of children —



Supplement to normal diet	Total gain in twelve weeks (ozs)	Average gain per child per week (ozs)
None	79	0 55
Cod Liver Oil	234	1 6
Halibut Liver Oil with milk	279	1 9
VIROL	526	3 6

The case with which the constituents of Virol are assimilated, and the physiological balance existing between them afford a ready explanation of these important results

IN INFLUENZA

Vita-Weat

REGD.

IN RELATION TO THE TREATMENT OF OBESITY

1 Each portion of Vita-Weat is of constant composition and weight It is easy, therefore, to prescribe a definite and a known ration of Vita-Weat when arranging a diet (1 lb of Vita-Weat contains 2132 calories)

2 The comparative richness of Vita-Weat in fat and the fat-soluble vitamins renders it possible to dispense with butter

3 The starch in Vita-Weat is completely broken up, and is thus much less liable than crude starch to form fat

4 The bran, the roughage and the Vitamin B in Vita-Weat encourage adequate elimination, and so promote that briskness of metabolism which is inimical to the clogging of the system with unwanted fat

Members of the medical profession may obtain a generous sample of Vita-Weat upon application to Peek Frean & Co Ltd., Keetons Road, London, S E 16

The Sun shines all the year round in SOUTH AFRICA

SUNSHINE, fresh air and rest is a prescription that can always be filled in South Africa And not the half-hearted sunshine that makes a pretence of warming Europe in Winter, but a full bodied lively sunshine that sends the blood coursing through the veins

For those who stand in need of such treatment South Africa possesses several excellent radio active springs situated in resorts which provide excellent accommodation and more than a little amusement to banish tedium and depression

The voyage to South Africa is in itself a delightful melange of rest cure and tonic—providing three weeks of complete relaxation amid the warm yet bracing sea breezes of the sunny Southern Atlantic

A booklet "Medicinal Springs of South Africa" gives detailed information and analysis of medical waters in various parts of the country Write to South African Railways, Tourist Bureau, South Africa House, London, W C 2

AMPHYL

(Chlorhydroxymetaxylene)

THE most recent advances in medicine have shown that Antiseptics, apart from their uses in hygiene and surgery are assuming great importance in the field of curative medicine Their value in prophylaxis is also rapidly increasing

Hitherto the Rideal Walker Index has been regarded as a standard of efficiency Recent research has shown that many antiseptics exhibit variable bactericidal and bacteriostatic values when tested with different organisms

Exact knowledge is very essential because of the important role they are called upon to play and the great dependence placed upon them

Disinfection of wounds demands special consideration in the choice of an antiseptic, which whilst destroying the invading organisms, must not at the same time cause injury to the leucocytes and thus prevent leucocytosis the most important factor in the healing process

Research in the field of antiseptics has shown that the Halogen derivatives of the cresols and xylenols are the most effective bactericides at dilutions which are well removed from those which damage tissue

AMPHYL Antiseptic (chlorhydroxymetaxylene) represents the latest advances in modern antiseptics It is of high bactericidal and bacteriostatic value and at the same time is non poisonous and non injurious to the tissues, and has a pleasant odour and taste

LONDON, S W 20

The acute lesions, which have the same general lineal distribution from pelvis to cortex, consist of dense cellular infiltrations The cells vary in proportion in different patches, but there are many polymorphs, together with various mononuclear types (such as lymphocytes and histiocytes) This infiltration is in the interstitial tissues, causing separation of the tubules, many of which are also disintegrated, above are dilated tubules No organisms could be demonstrated in these acute lesions, though the appearance and characters of the lesions suggest a bacterial or toxic origin The kidney otherwise shows minor changes, the convoluted tubules generally are swollen, but the glomeruli show no specific change

Liver—The liver cells in the central two thirds of the lobules show loss of distinct outline, their cytoplasm is vacuolated and contains small yellow granules (? bile), the nuclei, with few exceptions, stain quite well The cells of the outer third stain more uniformly and darkly—a more normal appearance Scattered irregularly in lobules and in portal tracts are small groups of blood cells (polymorphs and myelocytes) and some swollen endothelial cells These groups are within the sinusoids of the lobules or in the tissue of the portal tract There is no fibrosis, the bile ducts and portal vessels show no abnormality

It was not possible to test for fat in the material available, and so no statement can be made as to the cause of the central vacuolation of cells above noted The general appearance suggests an acute toxic damage and some stimulation of haemopoietic tissue

These experiments showed that toxic conditions may be produced in the pregnant rabbit when pregnancy is interrupted without a complete expulsion of the uterine contents, and that such conditions are associated with a failure in the secretion of the luteal hormone They suggested the possibility that toxic states observed during pregnancy in women might also be associated with an insufficiency in the luteal secretion, and that treatment with the luteal hormone (progesterone) might have beneficial effects It was therefore decided to determine the effect of treatment with corpus luteum hormone in a series of pre-eclamptic cases Messrs Schering Ltd very kindly put a generous supply of proluton at our disposal 1 c.cm of the preparation used contains 5 mg of synthetic progesterone This was administered intramuscularly in all cases

Clinical Experiments

So far only twelve cases have been treated The results have on the whole been encouraging, but the data are necessarily limited, since the number of severe cases suitable for experimental treatment passing through one hospital is small This preliminary report has therefore been communicated in the hope of encouraging other investigators to use a similar treatment, and thus lead to a more rapid collection of information

The following criteria were used in the choice of cases (1) The blood pressure was high, the systolic being 160 or over and the diastolic 90 or over (2) Oedema was present in all cases, and marked in most of them (3) Albumin was present in the urine, often in large quantities (4) The urea concentration was normal, and the blood urea was within normal limits (20 to 40 mg per cent) (5) The general clinical impression and the symptoms (such as headache, visual disturbances, and vomiting) were such as to suggest that eclampsia might be imminent

In ten out of twelve cases conservative treatment had been tried at home under the supervision of the hospital ante-natal clinics or under the patient's own medical attendant The period of treatment before admission extended over one to four weeks and the treatment included rest in bed on a low protein diet The patients were admitted to hospital only when they failed to show improvement or became worse under conservative measures Two of the cases were admitted as emergencies without any previous treatment

In all cases treatment was restricted essentially to the administration of progesterone, but the following basic precautions were taken (1) A balanced diet of approximately 1,650 calories was given, not salt-free and not protein-free, though the protein intake excluded red meat (2) In every case where oedema was a marked feature fluid intake was restricted to less than 40 ounces until the fluid output was greater than the intake, and the oedema showed signs of disappearing or had disappeared (3) Where headache was severe luminal was given in half-grain doses twice or three times a day In one case (No 4), where epigastric pain, acute headache, and sudden rise in blood pressure developed when only one dose of progesterone had been given, resort was had to venesection and the use of morphine Progesterone was given in 5 mg doses daily for the first three or four days, and thereafter, depending on the response, at longer intervals The results are presented in Table I the symptoms being graded + to + + + + according to the presence and intensity of headache, eye symptoms, vomiting, and oedema

Several features of the response to treatment are worthy of note In the first place, none of the patients developed fits, and all recovered Secondly, every patient showed a gradual improvement as judged by the signs and symptoms Blood pressure fell (though it is difficult to estimate what significance can be attached to such a comparatively inaccurate standard), while albuminuria, as estimated by Esbach's method, showed a gradual diminution in most cases In the third place the final result to the mother was complete recovery of kidney function eventually in all cases except one In this case (No 2) the patient was left with a mild nephritis Lastly, although foetal mortality was high (six out of twelve cases), all these deaths were by no means attributable to the toxaemic condition

The cause of the foetal deaths requires additional consideration The first foetal death (No 1) occurred *in utero* before the woman came into the hospital She was admitted as an emergency, and the foetal heart was never heard The second foetal death (No 2) was definitely due to prematurity The third foetus was born in a deformed condition, and the labour, which was prolonged and difficult, showed abnormality of uterine action (non-polarity of the uterus) Special interest may possibly be attached to the fifth foetal death (No 7) The mother's response to treatment was rapid and satisfactory, so that the dosage was reduced to 5 mg every fourth day It was on the fourth day after her last injection (five weeks after the beginning of treatment) that the mother complained of feeling worse and showed a rise in the blood pressure On examination the foetal heart which had been heard on the previous day was no longer audible Surgical induction was performed, and the child was stillborn It is possible that his death might not have occurred if more frequent doses had been given

In one case (No 4) it was observed that treatment with corpus luteum hormone appeared to cause a delay in the onset of labour Because of failure to improve beyond a certain point the membranes in this case were ruptured artificially at twenty-nine weeks and the treatment with progesterone was continued The patient did not go into labour for five days, and then only after the temporary cessation of treatment Because of this, and because of the high foetal mortality in the earlier cases induction of labour at or near term when the condition of the mother

such cases admitted between May 1 and October 31, 1935 Similar periods were chosen in order to exclude the possibility that seasonal variations might affect the incidence and severity of the condition

The results are given in Tables II and III Out of ten severe cases admitted in 1935 and treated conservatively, four developed fits, and two patients died, while out of twelve severe cases treated in 1936 with corpus luteum hormone none developed fits and none died The results therefore appear to be suggestive and encouraging

In an investigation of the possible value of progesterone in the treatment of certain toxaemias of pregnancy it was obviously desirable to select severe cases, since the significance of results obtained could then be more easily estimated At the same time it is well realized that if the treatment was definitely shown to be effective it would be advisable to apply it at an earlier stage, and to determine whether under such conditions it might not be of prophylactic value

Summary

1 Certain experiments, in which toxic conditions leading to death were produced in pregnant rabbits, are described, these conditions were associated with a failure in the secretion of the luteal hormone

2 The results obtained following the administration of progesterone in twelve cases suffering from severe pre-eclamptic symptoms are given Clinical improvement appears to have been produced in these cases

3 It is evident that the numbers are too small to establish formal proof of the efficacy of the treatment, and the results are published at this stage because it would take many years to collect adequate data in a single hospital The results appear to be sufficiently encouraging to deserve testing on a wider scale without delay

We should like to express our gratitude to the honorary staff of the Elsie Inglis Memorial Hospital for permission to use some of their cases, and to the Medical Research Council for defraying the expenses of the experimental part of this investigation

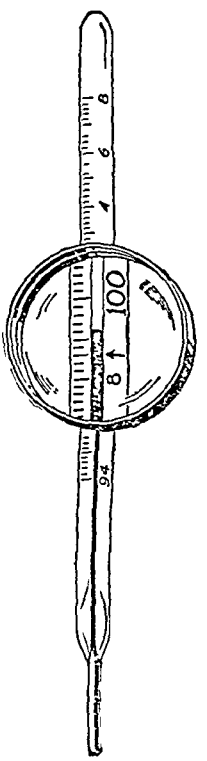
C Kroetz (*Med Klinik* November 6, 1936, p 1521) points out that carbon monoxide poisoning is a danger which may arise in garages, streets, factories, tunnels, and domestic houses It may produce in the heart muscle haemorrhages and necrotic patches especially close to the papillary muscles of the mitral valve Entering the upper respiratory passages it affects the vagus, causing spasm of the coronary blood vessels Later, arteriosclerotic changes occur in the vessel walls The electrocardiogram often gives evidence of these pathological changes Clinically, a heart with necrotic foci following carbon monoxide poisoning reacts more quickly with attacks of angina pectoris Kroetz, acting as referee in a compensation case, showed that symptoms of cardiac stenosis must be carefully looked for in cases of CO poisoning In 1915 an engine driver of 38 had an attack of angina pectoris after working in a tunnel with a known high CO content Two other well authenticated attacks occurred in the same manner in 1922 and 1928 Previous to 1915 the patient had had no heart trouble Although he was off work for 285 days between 1915 and 1922 his symptoms were put down to neurosis He was pensioned off in 1933 In 1936 upon re examination his condition had not deteriorated Syphilis and senile arteriosclerosis had been excluded in 1915

THE RELATION BETWEEN THE HYPOCHROMIC ANAEMIAS AND IRON DEFICIENCY

BY

J. V. BROCK, D M., M R C.P.
Assistant Director of Research in Medicine, University of Cambridge

There has been much speculation as to the mode of action of iron in the hypochromic anaemias, and especially as to the reason why it requires to be given in large doses The successful treatment of the hypochromic anaemias with large doses of iron has been one of the most encouraging chapters in medicine during the last decade, and iron can now be regarded as a specific remedy



Schulten (1930) has emphasized the importance of large doses in the case of ferrum redactum He showed that in some cases this preparation could be given for four weeks in doses of 2 grammes (30 grains) daily without any response, but when the dose was raised to 6 grammes (90 grains) there was an immediate rise of reticulocytes and return of the blood picture to normal In this country and in the U S A the preparations of iron most in vogue until recently have been iron and ammonium citrate in doses of from 60 to 90 grains daily, and pil ferri carb (Blaud's pill) in doses of from 45 to 90 grains daily Although it has been recognized that some patients respond to considerably smaller doses (Witts 1933), the necessity for the large doses mentioned as average optimum doses has been very clearly established in clinical experience (Dameshek 1934, Heath, 1933, Schulten, 1930 Witts, 1933) And there is no question that the specificity of iron therapy has only been generally accepted since these preparations have been used in large doses as originally suggested by Blaud (1832)

Definition of Hypochromic Anaemia

A hypochromic type of blood picture may be found in association with almost any disease picture and may respond to a greater or less degree to iron therapy The term "hypochromic anaemia" is, however used in this paper to signify a certain group of cases The blood picture is characterized by a low colour index, hypochromia and microcytosis in the stained film, and a low mean corpuscular haemoglobin concentration The number of white blood corpuscles is at or below the normal level In the absence of treatment the course of the anaemia is chronic or torpid, the reticulocytes are within normal limits, and there is no spontaneous recovery In the absence of complications such as fever, sepsis, cancer, nephritis, or pronounced arteriosclerosis, iron therapy causes the blood picture to return to normal provided it is adequate and, if necessary prolonged In one of its purest forms hypochromic anaemia is found in women of the child-bearing epoch and is commonly associated with achlorhydria or hypochlorhydria This syndrome has been very fully described in the literature as idiopathic hypochromic anaemia or chronic microcytic anaemia (Faber, 1913 Witts, 1930 Waugh, 1931 Minot 1932, Dameshek, 1933) Quite frequently chronic blood loss or dietetic inadequacy are believed to be aetiological factors Heath (1933) found that of eighty-four cases responding to iron 93 per cent were idiopathic in association with reduced gastric acidity, or were associated with chronic haemorrhage or dietary deficiency It is this group of cases in an uncomplicated state which is used for the study of the relation of hypochromic anaemia to iron deficiency

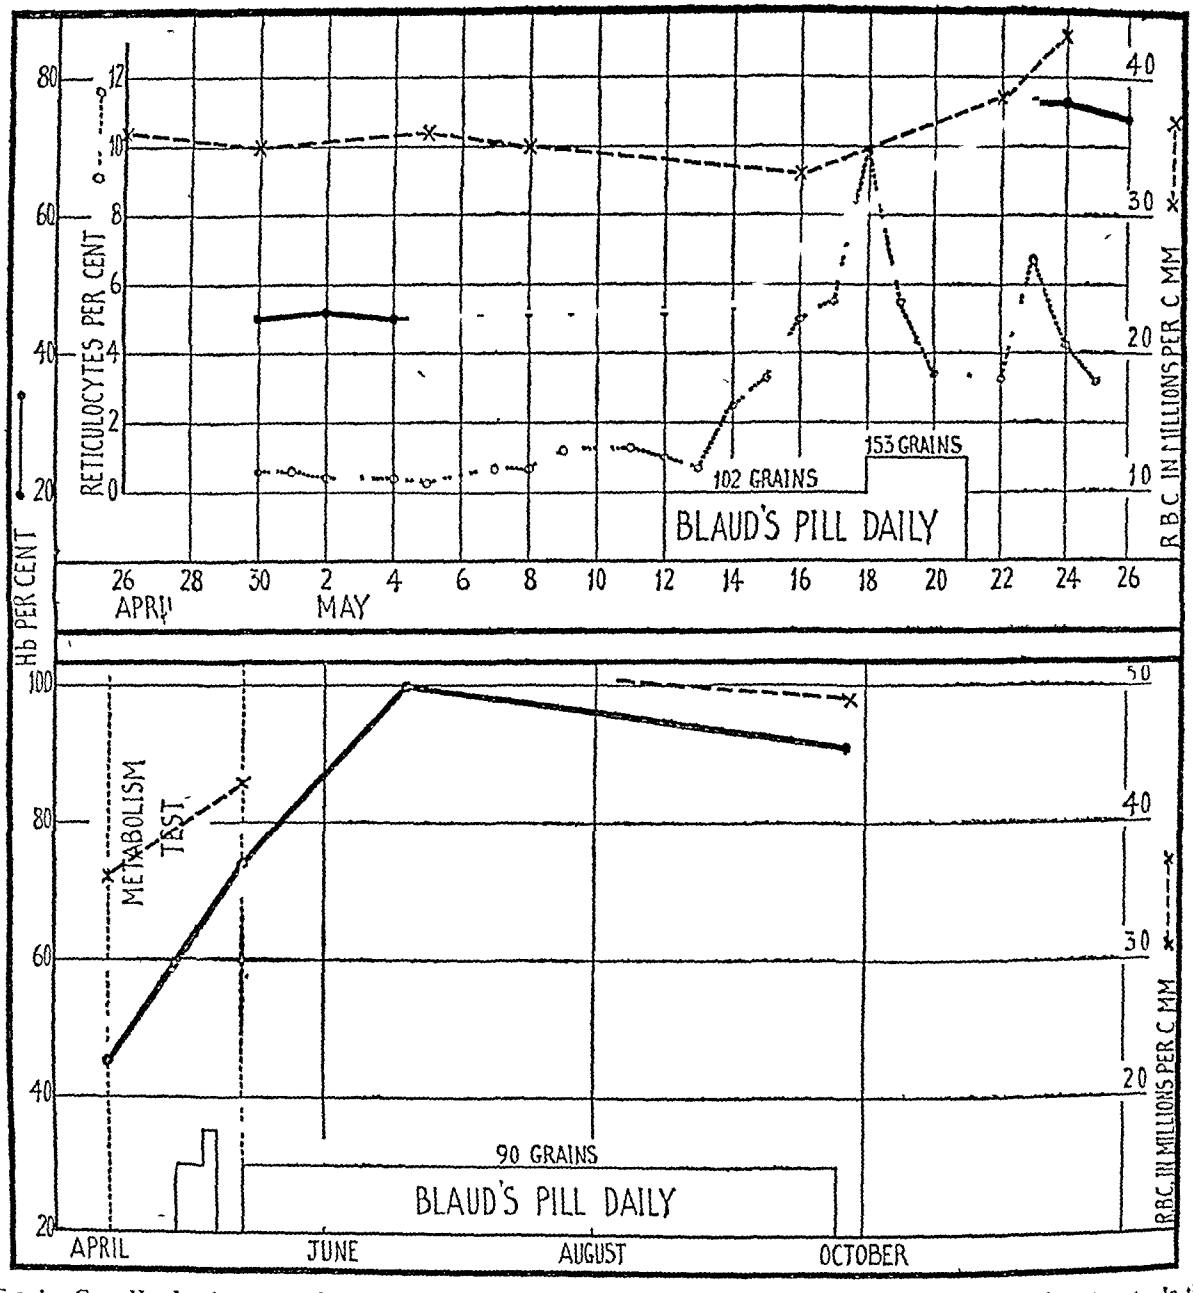

FIG 1.—Case II. In the upper chart is a detailed record of the response of the blood to a brief period of treatment. In the lower chart the patient's subsequent progress is recorded. In the lower chart the period of time represented in the upper chart is condensed on to a smaller scale between the dotted lines. Iron retention, May 12–May 21, was 2,491 mg. Haemoglobin rise, May 12–May 26, was 29 per cent., representing 670 mg. of iron.

ivalent of the newly formed haemoglobin was calcu-ed in each case on a presumed circulating blood volume 5 litres, using 0·335 per cent. as the iron content of :moglobin. In this way it was possible to observe the :moglobin response of patients when the amount of iron actually reaching the body from the intestine was known.

Case I

This was a case of hypochromic anaemia associated with a gastric ulcer and presumably due to chronic blood loss in the past. The patient was a male aged 17, treated three years before (that is in 1931) for anaemia. On March 9, 1931 his blood count was: red cells 3,500,000, haemoglobin, 25 per cent. On March 16, after iron therapy, haemoglobin was 71 per cent. 1934 complaining of epigastric pain and lassitude. A-ray examination showed a large lesser curve ulcer. Test meal: free hydrochloric acid 0·26 per cent.; no occult blood in stools on repeated examination. Red blood count 5,370,000 per c.mm.; haemoglobin 62 per cent., white blood count, 7,700 per c.mm.

The patient's iron balance was measured, and 90 grains a day of Blaud's pill were given for ten days. Of this he retained 639 mg. of iron. He received no further treatment for three weeks. At the end of this period his haemoglobin had risen to 92 per cent. This rise of 30 per cent. would represent 693 mg. of iron added to the circulation if the patient had a blood volume of 5-litres. He was a small individual, however, and the new haemoglobin must therefore have represented an addition of iron to the circulation about equal to the amount of iron retained. When iron therapy was renewed the haemoglobin rose to 110 per cent., and two years later the patient is still well.

Case II

This was a case of idiopathic hypochromic anaemia in a female, single, aged 30. She complained of shortness of breath and pallor for two months. Moderate diet. Cyanemia not excessive. No other blood loss. Test meal: no free hydrochloric acid after gruel but after histamine 0·2% per cent. A-ray examination showed no abnormality of stomach or duodenum. Red blood count, 3,460,000 per

After Influenza—

Many patients find the most trying features of influenza are the prolonged depression and weakness which follow it The convalescent diet must contain tonic properties to restore health as quickly as possible, and **a diet rich in vitamins** and mineral salts is essential By ordering Bemax one can assure for patients a high Vitamin B intake, together with Vitamins A and E Bemax also contains valuable phosphates, and is one of the richest food-sources of readily assimilable iron

Either as a protection against Influenza in times of epidemic, or as a restorative food to shorten convalescence, **Bemax has proved invaluable** It is a pleasant food, very easily digested and assimilated, and will be taken readily even in those cases where gastric symptoms predominate

a day, as judged by clinical experience with large series of cases (Dameshek, 1934, Heath, 1933, Witts, 1933) There is no reason to believe that tablets of ferrous sulphate or ferrous chloride are any better absorbed than is the iron in freshly prepared Blaud's pill, so that they should be given in doses containing the same quantity of iron—for example, 15 to 30 grains daily in the case of ferrous sulphate exsiccatus Many cases will respond to smaller doses just as they will to doses of Blaud's pill smaller than 45 grains daily, but, as has been shown, there is no way of distinguishing clinically between those needing small and those needing large doses Fullerton (1934) found that only ten cases out of twenty-one responded satisfactorily to ferrous sulphate exsiccatus in a dose of 9 grains daily

Various preparations of soluble ferrous salts are being put on the market which, because of their smaller bulk, will probably replace the familiar Blaud's pill But whatever the preparation there must be a reasonable assurance that the iron will remain in a ferrous state, and they must be given in a dose which contains a minimum of 300 mg of metallic iron daily Tablets of ferrous sulphate as made by Glaxo appear to fulfil these requirements, and are very convenient and palatable The dose of 9 grains per day, however, which is frequently recommended, cannot be regarded as an average optimum dose About 50 per cent of cases will respond adequately (Fullerton, 1934), but unless frequent haemoglobin estimations are being performed the dose should always be at least 15 grains a day, and may have to be larger If ferrous chloride is being used in a syrup solution, as recommended by Witts (1936), an average optimum dose varies from 9 to 18 grains a day at least (300 mg of metallic iron), according to whether the ferrous chloride is anhydrous or not

In resistant cases the dose should always be raised to the maximum before despairing of iron, and since there are still many unexplained factors in the aetiology of hypochromic anaemia a diet rich in first-class protein and vitamins should always be insisted on *

During the three years in which the experiments here referred to were being conducted the writer held successively the Leverhulme Research Scholarship of the Royal College of Physicians and the Walter Dixon Scholarship of the British Medical Association He has pleasure in expressing his indebtedness to Dr George R Minot for the impetus to undertake the work, and to Dr Donald Hunter and Dr J M Vaughan for help and advice

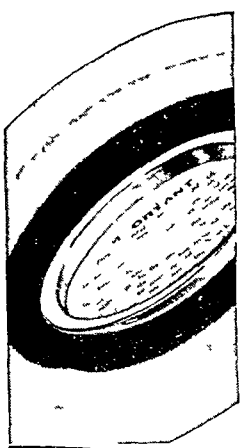
---

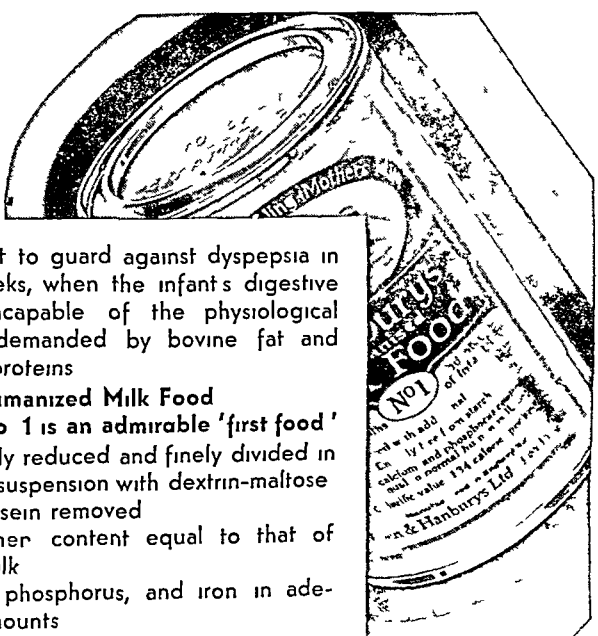
J P Strombeck (*Nord med Tidskr*, December 5, 1936, p 1996) finds from a study of the literature that opinions are still divided as to the merits of the excision and suture of recent wounds as advocated for the first time by Friedrich in 1893 The author has therefore tried to throw light on this treatment, which has been applied since 1928 at the Serafimer Hospital in Stockholm to wounds accidentally inflicted Since September 1932, records have been kept with special reference to the nature of the wounds according as they were inflicted by cutting or blunt objects, or were associated with suppuration, necroses, haematomata, reopening of the wound, and other complications In the course of three years about 3,000 cases were treated, approximately three quarters of the patients being males In nearly every case the injuries did not entail residence in hospital, and those cases were excluded from the analysis in which compound fractures of the long bones had occurred or in which the wounds were very deep and extensive The treatment consisted in washing with a soap solution and then with alcohol after local anaesthesia had been induced The walls and floor of the wound were then excised to a depth of one millimetre Before, during, and after this excision the wound was irrigated by a solution of chloramine Ligatures and sunk sutures (except tendon sutures) were avoided as much as possible and silk was employed for the skin sutures The author's findings are reproduced in several tables in which information is given about the character and site of the injuries and various other data The author's conclusion is favourable to this procedure, which he does not however, recommend unreservedly in general practice It is most suitable for hospital practice and even here care must be taken in the after-treatment lest secondary opening of the wound ensue

In Gastro-Intestinal Disorders

In such conditions it is a primary consideration that the food should be light and unirritating In gastric and duodenal ulceration and in the dyspepsias,



'ALLENBURYS' BEEF JUICE



may safely and advantageously be given, where beef tea would often increase the pain and have a harmful effect Because of its high protein and vitamin content, obtained by preparation at a low temperature and concentration *in vacuo*, 'Allenburys Beef Juice provides a valuable means of keeping up a patient's strength in persistent sea-sickness and in such diseases as dysentery and cholera

Descriptive literature and clinical trial sample will be sent on application

Clinical Results

The following data refer to 157 male patients treated with the gonococcus antitoxin, and these may be separated into

Acute uncomplicated cases	42
Acute complicated cases	84
Chronic complicated cases	31

The acute complicated cases included epididymitis, 37, arthritis, 27, vesiculitis, 8, prostatitis, 6, conjunctivitis 3, iritis, 2 The chronic complicated cases were epididymitis, 14, arthritis, 11, prostatitis, 4, vesiculitis, 1, iritis, 1

It is extremely difficult to summarize the clinical results of such an erratic disease as gonorrhoea Some cases were obviously more severe than others, and the resistance of the patients varied considerably, but even so the following may be taken as a fair indication of the percentage of successes or otherwise of the antitoxin treatment excellent, 49 6, good, 26 9, fair, 14 8, bad, 5 9 Clinical relapses occurred in only 6 6 per cent in this series

The duration of times mentioned in this paper indicating the periods in which a "cure" or some clinical improvement was attained should not be taken too literally or criticized too severely Times have been mentioned so that the reader may form an approximate evaluation of the results obtained The times required to effect a cure in gonorrhoea are subject to so many varying factors, more especially the personal equation of the assessor, that they are seldom published, for who is bold enough to state *precisely when* a gonococcal infection is cured? My tests of cure have been described elsewhere They are extremely rigid, and a certain period of time, varying according to the type of case, must elapse while they are being applied In evaluating a cure it is the method in which the disease retrogresses, pathologically as well as clinically, on which the expert mostly relies Careful notes and the results of the chronological series of pathological findings reveal the evolution of the process of cure, and are more valuable than a single set of tests applied on one day only Hence a fair estimation of when an infection ceased is most accurately obtained by scrutinizing the case record after the patient has been under observation and tests for a prolonged period In this investigation, although some defaulted,' each patient was kept under observation as long as possible, no case was discharged at the earliest moment

Acute Gonorrhoea, Uncomplicated

Dysuria irritation and discomfort subside earlier than usual The patients commonly declare how well they feel and express their belief in the efficacy of the injections as they feel much better for them"

An analysis of the thirty-six cases that completed the tests of cure and were observed for at least three months shows that a 'cure was effected in two cases in sixteen days one case nineteen days, four cases, three weeks, twelve cases four weeks, five cases, five weeks, seven cases six weeks and in five cases, eight weeks

In a week even the uncomplicated cases of acute gonorrhoeal urethritis have given rise to dissemination of gonococci through the blood stream, although this may not be apparent If the antitoxin is given early enough, however complications such as posterior urethritis, vesiculitis prostatitis epididymitis, and arthritis seem to be prevented Among the total of forty-two cases only three relapsed or developed a complication

In one case the urethritis ceased on the fifteenth day, but recurred slightly on the twenty first day, although the patient had received fifteen daily doses of 1 c.cm of the concentrated product The second case developed a tenosynovitis of the right wrist four weeks after 45 c.cm of the unconcentrated antitoxin, the dosage being 10, 15, and 20 c.cm on three successive days

Epididymitis

In general, complete relief from pain is obtained in twenty-four to forty-eight hours, and occasionally a sudden and astonishing cessation of pain in five to six hours, accompanied by a rapid decrease in swelling Several patients discharged themselves from hospital within five or six days because "they felt so well' It is also worth recording an experienced and impartial observer's note in one case twenty-four hours after the first injection of 10 c.cm of unconcentrated antitoxin—namely that he had "never seen such a rapid and marked improvement before"

An analysis of forty-two cases indicated that one patient was "cured" in sixteen days four in twenty one days, one in twenty-three days, one in forty days one in forty-five days, seven in four weeks six in five weeks, three in six weeks, one in seven weeks, seven in eight weeks, three in ten weeks five in twelve weeks, one in fourteen weeks, and one in sixteen weeks Among fifty cases only one relapsed

This patient had a bilateral vesiculitis with a left epididymo orchitis of two months duration He then received only 6 c.cm of the unconcentrated antitoxin 1, 2, and 3 c.cm on three successive days, and developed a right epididymo orchitis four weeks later

Arthritis

Patients under this category, "arthritis, acute and chronic," include the conditions arthritis with effusion, fasciitis, and tenosynovitis The time required to obtain "*nil* abnormal" clinically and pathologically in urine, vesicles, prostate, and urethra (all tests being pathologically clear except for an occasional positive gonococcal fixation test) was as follows in acute cases eight in four weeks, six in six weeks, one in seven weeks two in eight weeks two in ten weeks, two in twelve weeks, one in twenty-four weeks and one in forty weeks In chronic cases one in three weeks, one in five weeks, three in six weeks, two in eight weeks, and one in nine weeks

The clinical results are rapid in recent acute cases, pain and swelling ceasing in a few days, sometimes after the first injection Generally the joint appears normal, has full mobility in a week, and the result is permanent

For example a severe case of acute gonococcal arthritis complicated with a bilateral epididymitis, and a very painful arthritis of both knee joints, tense with fluid had regained normal movement in both knee-joints on the fifth day pain was absent and very little fluid remained In fifteen days this patient was normal clinically and discharged from in patient treatment

Similarly with the chronic cases Generally the patients are able to walk or to use arms or hands without disability, and to leave hospital within eighteen to twenty one days instead of the usual five to six weeks In most cases relief from pain occurs within thirty-six to forty eight hours with rapid diminution of the effusion and increased mobility of the joint In one chronic case with four years' history, where a cure was effected after six weeks, the patient made the observation that he had 'no pain, and had not been so comfortable for months" Another case of arthritis, also of four years' duration, was "cured" in nine weeks All cases recovered

PROGESTERONE IN PRE-ECLAMPTIC TOXAEMIA

BY

J M ROBSON, M D , D Sc

Lecturer in Pharmacology University of Edinburgh

AND

S J PATERSON, M A , M D , F R C S Ed

Honorary Obstetrician Elsie Inglis Maternity Hospital Edinburgh

Recent work on the physiology of pregnancy has produced evidence which strongly suggests that the luteal hormone progesterone is necessary for the maintenance of gestation and for the nutrition of the developing uterine contents In some species the hormone is produced essentially by the corpus luteum and the removal of the ovaries or of the corpus luteum leads to an interruption of the gestation In other species, including the human, removal of the ovaries is consistent with continuation of a normal gestation and it is presumed that in these species the luteal hormone is produced by the placenta, from which organ it has indeed been recovered

Experimental Work on Animals

In experiments performed some time ago (Robson, 1934) it was desired to determine the possible effect of the placental activity on the uterus following removal of the foetuses For this purpose the technique described by Weymeersch (1912) and by Hammond (1917) was used, the embryos were removed under aseptic precautions in pregnant rabbits through small incisions in the uterine wall When the operation was performed at about the mid stage of pregnancy or shortly afterwards it was found, as had been previously described that the placentae might be retained for varying periods within the uterine lumen and were then expelled When, however, the embryos were removed at a later stage of pregnancy the course of events was quite different The animals very rapidly developed symptoms of acute intoxication and died, sometimes within twenty four hours of the operation On post mortem examination an acute toxic condition was found and it appeared likely that the source of the intoxication was within the uterus

In further experiments precautions, including strict asepsis, were used, but the results were nevertheless the same It appeared possible that the removal of the embryos was followed by acute changes within the remaining uterine contents which resulted in an intoxication of the animal As the uterus was unable to expel these contents death of the animal rapidly followed Since removal of the embryos is followed by a cessation of the luteal secretion (Hammond, 1917) it was concluded that the condition within the uterus might be due to a failure of the nutrition of the placenta following the removal of the luteal secretion

More recent experiments on the function of the corpus luteum during pregnancy have also yielded some interesting and suggestive results In the rabbit the removal of the pituitary during pregnancy is followed by a degeneration of the corpus luteum and by an interruption of the gestation, when the operation is performed after about the middle of pregnancy the uterine contents are expelled within twenty-four to forty eight hours By the administration of small doses of gonadotropic hormone it is possible to maintain the activity of the corpus luteum after the removal of the pituitary, and when gonadotropic hormones are administered to animals hypophysectomized during pregnancy it is possible to maintain the gestation (Robson, 1936) In some such experiments the maintenance of the luteal function was only very partial as a result the gestation was not maintained and death of the embryos ensued, but the uterine contents were not expelled Under such conditions toxic symptoms occasionally supervened rapidly leading to the death of the animal

Details of One Experiment

In one such experiment a histological examination of the tissues was made This animal was hypophysectomized on the seventeenth day of pregnancy, and then was given small doses of gonadotropic hormone twice daily Careful palpation together with the examination of the weight curve showed that after a few days the pregnancy was not progressing normally On the morning of the sixth day after the removal of the pituitary the animal went into convulsions It was obviously very ill and was killed in order that a subsequent post mortem examination might be as satisfactory as possible

Post mortem examination showed an acute toxic condition the uterine contents were in a state of partial reabsorption The pituitary had been completely removed The corpora lutea showed considerable small cell infiltration

Professor Drennan very kindly carried out a microscopical examination of the liver kidneys and spleen and reported as follows

Spleen—The only feature in this is marked engorgement of the pulp sinuses

Kidney—This organ shows acute and subacute lesions The latter take the form of surface depressions due to disappearance of tubules with bunching together of the surviving glomeruli and fibrous overgrowth It is not possible to give the age of this with absolute accuracy but it may be regarded as from a week or ten days at least In places this loss of tubules and interstitial fibrosis extends inwards as far as the pelvis The glomeruli and vessels do not appear appreciably altered in these areas

coccus is a delicate organism easily destroyed, possibly with the liberation of toxin If this is the explanation then the patient may be experiencing a toxaemia as the result of auto-inoculation, further doses resulting in a complete neutralization Or the gonococcus antitoxin may possess some residual toxin which, circulating in the serum of the horses, is contained in the antitoxin

It may be that some of the reactions are due to impurities in the toxin used in the preparation of the antitoxin I have been unable to obtain evidence that the reactions are due to protein in the antitoxin In order to demonstrate this point a series of controls were carried out on in-patients in the same ward under identical conditions, first with a natural horse serum, and secondly with a concentrated horse serum of the same concentration as the concentrated gonococcus antitoxin In no instance did the serum influence the infection or the patient, nor was there any evidence of pyrexia or other reaction These controls were also important in demonstrating that the effects which were obtained with the antitoxin were presumably specific and not to be ascribed to "protein shock" Again, variations in the type or strain of gonococcus may affect these reactions, and patients may vary in reaction to the antitoxin according to the resistance they may possess individually against the infection Possibly the patients in group (*a*) have a poorer resistance than those in group (*b*) It has to be admitted that it is not yet possible to explain all the different phenomena and types of reaction that have occurred, but clinically it seems certain that an active as well as a passive immunity is established

Discussion

At the time of writing a total of 789 injections have been administered to 178 cases Early in the investigation 3,090 c cm of unconcentrated gonococcal antitoxin, and later 452 c cm of concentrated gonococcal antitoxin, have been given intramuscularly or deep-subcutaneously Hitherto I have hesitated to give the antitoxin intravenously, but more satisfactory results should be obtained by this route The results obtained with the concentrated antitoxin have been, if anything, better than those treated with the unconcentrated product

When treating out-patients it was essential to avoid reactions so far as possible, and more recently the dosage has been restricted to 1 c cm of the concentrated product daily Patients have received 1 c cm each day over the period of a fortnight, and clinically appeared to be cured Obviously the term "cured" cannot be employed until the patients have been subjected to exhaustive clinical and laboratory tests There is always the disadvantage that the out patient may not follow the instructions which have been given to him, so that in many ways the use of the antitoxin in the out-patient department is a more severe test than when the patient is in hospital under supervision Treatment is further complicated by the varying resistance of the patients to the infection, which may, for instance be good, medium or poor, so that it is not possible to be definite in regard to dosage Various schemes of dosage have been on trial, and although in one case as much as 100 c cm of the unconcentrated antitoxin was administered, my limited experience indicates that too large a dose is a mistake It is better to give small doses regularly than large doses occasionally In most cases the best results seem to be obtained when the injections are given daily in small doses of 1 to 2 c cm of the concentrated antitoxin not increasing the dose as the injections proceed, but maintaining it at the same level and continuing until the patient has improved clinically—that is, until the discharge ceases, pyrexia is not provoked, and complications, such as an arthritic effusion, disappear

The requisite dosage may vary according to the individual resistance of the patient to the infection Patients may be separated into three groups accordingly (*a*) good (*b*) medium, and (*c*) poor resistance Probably (*a*) require a very small total dose, recovery is remarkably rapid—two injections may be sufficient to enable the patient to effect a cure, (*b*) require the daily repetition of small doses over a longer period than (*a*), (*c*) require larger doses over a longer period still than (*a*) or (*b*)

The more acute the case the greater the necessity for the antitoxin Delay in administering the serum renders the prognosis less satisfactory Given early in arthritis the effect is rapid, administered later there is temporary improvement and then a tendency to relapse, necessitating further treatment

Vaccines and sera hitherto produced are declared to be useful mostly in the chronic or only in the acute stages, seldom or never are they recommended for both types of case These preliminary trials seem to indicate that this antitoxin affects both acute and chronic cases favourably It may be that further refinements will be possible in the production and perhaps the method of evaluating the product may be improved but the fact remains that this experimental gonococcus antitoxin would appear to be the most valuable remedy which has yet been forthcoming since gonorrhoea was subject to scientific investigation

Summary

1 In this preliminary report the results obtained with this experimental gonococcus antitoxin have been distinctly encouraging

2 Acute and chronic cases complicated and uncomplicated, respond equally well, which is in marked distinction to other biological preparations hitherto available

3 Reactions and results indicate that this antitoxin possesses specific therapeutic properties, properly regulated controls confirm this

4 Clinical evidence suggests that active as well as passive immunity is established

5 Sufficient data are available to indicate that a remedy for the treatment of gonorrhoea has been evolved which offers considerable promise

I wish to extend my thanks to Professor E Mellanby for initiating this research to Dr Mervyn Gordon for his expert advice particularly from the serological aspect, to Sir Frederick Menzies for his encouragement and kindness in allocating hospital accommodation and to members of his staff for their co operation, to Professor de Wesselow for valuable assistance in the later stages of the investigation and for help from members of the staff at St Thomas's Hospital, to Dr N S Ferry and Dr Stanley White of the Parke Davis Laboratories to whom acknowledgement is made in the paper and finally to Parke, Davis and Co for their courtesy and ready acquiescence in placing their resources at my disposal

had reached a satisfactory but stationary point was resorted to in most of the later cases This measure was attended with marked success

Discussion

In presenting the results in these cases we fully realize the difficulties of assessing adequately the part played by the treatment with progesterone It is possible that rest in bed under hospital conditions might account for the undoubted amelioration in the symptoms and that the same series of cases treated conservatively in hospital would have shown the same ultimate results In view of the difficulties of devising a true control experiment we decided that it might be of value to study the figures for the previous year We therefore surveyed the records of all pre eclamptic cases which were admitted to hospital between the dates of our experiment (May 1 to October 31, 1936) and compared these with the records of all

TABLE II

	1935	1936
Total cases admitted with pre-eclampsia	21	31
Mild and moderate	11	18
Severe	10	13

TABLE III—*Comparing the Result of Conservative Treatment and Treatment with Progesterone in Severe Cases*

	1935	1936
No of cases	10	13
No of cases conservatively treated	10	1
No of cases developing fits	4	1
No of deaths	2	1
No of cases treated with progesterone	0	12
No of cases developing fits	—	0
No of deaths	—	0

Discussion

The outbreak caused two deaths, and at least twenty-one persons were infected by *B enteritidis*, yet scientifically the food conveying the infection was not traced However, there is little doubt that the canned mutton was responsible The reasons for this belief are

1 Every inmate taken ill had eaten the mutton

2 All inmates who had not eaten the mutton were unaffected

3 Every other article in the dietary was used in the hospital block, and no cases occurred there

4 All kitchen maids showed a positive agglutination reaction to *B enteritidis* except one and she was absent on the day that the mutton was in the kitchen

It is actually impossible to say what the source of the infection was, but an attempt can be made to deduce it Savage and Bruce White state that there are three possible primary reservoirs

1 A habitat outside the animal (including human) body

2 Infection from a human case—infected sufferer or passive carrier

3 Infection from an animal source—

(*a*) Specifically infected animal used for food

(*b*) Sound food infected by a person suffering from a Salmonella infection or acting as a carrier of such bacilli

1 Savage and White maintain that while this source is possible suspected material has always yielded negative results, and in this outbreak I find it difficult to admit the possibility

2 This source can be discounted fairly certainly, as no illness at all suggestive could be discovered

3 There was no evidence to show that the mutton could have been infected from an animal source in the institution The food was traced from the tin to the wards, and it seems certain that it could not have been infected Thus we are left to consider

(*a*) Was an infected animal used for the food—that is, ante-mortem infection?

(*b*) Was the animal originally healthy and the meat infected post mortem?

If (*a*), then the bacteria survived the "cooking" process, which is unlikely Moreover, a primary *B enteritidis* infection of sheep is very rare Does (*b*) appear to be a more likely source of the infection? From the number ill and proved to have been suffering from a *B enteritidis* infection and the number who partook of the canned mutton—that is twenty-three out of over 700—it is reasonable to suggest that one tin only was infected Two wards (M 2 and F 2) supplied thirteen out of the twenty-three cases The cases at the time of the outbreak were classified as mild, moderate, and fatal There were nine mild cases twelve moderate, and two fatal cases Ward M 2 had eight moderate and two fatal cases, and ward F 2 showed four moderate cases Thus it seems that the portion of the can most heavily infected went to ward M 2 and the next most heavily infected to ward F 2 The average incubation period in ward M 2 was twenty hours and in ward F 2 thirty one hours It is therefore reasonable to say that there was no uniform infection of the meat in the can as might be expected from an ante-mortem infection but a grading from one portion to another, as might be expected if one portion was originally infected before sealing of the tin and spread gradually by continuity of the material This suggests, therefore, the probability of a post-mortem infection rather than an ante-mortem infection

Summary

1 An outbreak of gastro enteritis in which two persons died and twenty-one persons were victims was found to be due to *B enteritidis*

2 It is suggested that canned mutton was the food involved

3 By probability only, and by no scientific proof, it is suggested that the mutton was infected in some manner, and was not taken from an infected animal

I wish to thank Dr Sidney Davies, medical superintendent, for permission to record this outbreak and for his untiring help, and also Dr Scott of the Ministry of Health for his bacteriological reports I am greatly indebted to Dr W G Savage, county medical officer of health, Somerset, for his constructive criticism

TREATMENT OF DEPRESSED FRACTURES OF THE MALAR BONE

BY

A. B. K. WATKINS, M S.Lond, F.R C S.

Honorary Ear Nose and Throat Surgeon to the Newcastle General Hospital N S W and to the Mater Misericordiae Hospital Waratah, N S W

A fracture which is becoming common is that in which the malar bone is pushed into the antrum Sir Harold Gillies informed me that it is becoming particularly common in England, as the almost universal use of safety glass in cars is causing this fracture to replace the former facial cuts in automobile accidents, but even in Australia, where safety glass is only now coming into common use, it is often seen

In this fracture the orbital, antral, and zygomatic attachments of the malar bone are fractured and the body of the malar bone is pushed partly or wholly into the antrum The malar bone being strong is rarely comminuted but not so the lateral wall of the orbit and the infra orbital margin of the maxilla If the case be seen soon after the accident the diagnosis is easily made, but even if seen after several hours the depression of the malar bone is rarely masked by the superficial swelling When there is much swelling an alteration in the shape of the lower edge of the orbit is generally such as to make the presence of this fracture highly probable The diagnosis in difficult cases is made by x-rays, and especially by one taken vertically of the side of the head from below upwards (Stone's position—Gillies, Kilner, and Stone, 1927), when the prominence of the zygomatic process on the affected side will be absent

Often the fracture causes loss of sensation over the area of distribution of the infra-orbital nerve As a rule the antral cavity is filled with blood clot

Difficulties in Treatment

Treatment by the usual methods is unsatisfactory, the multitude of methods advocated indicating this The advice generally given is to make an incision under the lip similar to that made in a Caldwell-Luc antrostomy and to open the antrum and elevate the malar bone The reduction of the fragment is easy by this method, but no facilities are provided for retaining the bone in the correct position, and no allowance is made for drainage of the antrum Such drainage should be instituted after an antrum full of blood clot has been opened into the buccal cavity, which carries such an infective flora

Iron Exchange of the Body

Examination of the facts of the distribution and exchange of iron in the body lends support to the view that the hypochromic anaemias are the result of a state of iron deficiency in the body These facts are given in the table It will be seen that more than half of the iron

Iron Stores and Exchange Normal Human Approximate		Authority
Total in body	4-4 5 grammes	White House Conference 1932
Circulating blood	2 44	Fullerton et al 1933
Circulating haemoglobin	2 31	
Liver	0 15-0 25 gramme	Ashby 1912
Daily Iron Exchange		
Average diet total	10 20 mg	Reznikoff et al 1934
available	7-9 mg	Widdowson and McCance 1936
Poor diet total	5-10 mg	Davidson and Fullerton 1933 and 1935
Faeces	5 20 mg	Reznikoff et al 1934
Urine	0 5-1 mg	Marlow and Taylor 1934
Haemolysis of effete red cells	80 mg	Wright 1934
Iron in bile	0 5 mg	Henrique and Roland 1928
Special Sources of Loss in Female		
Menstruation (per month) normal	3 8-78 4 mg	Baldridge 1935 Barer et al 1935 Gillett et al 1918 Ohlson and Daum 1935
Iron content in full term foetus	375 mg	White House Conference 1932
Iron secreted in lactation	*750 mg*	*Fullerton 1936*

* 5 litres of blood 13 8 grammes haemoglobin per cent 0 335 gramme iron per cent in haemoglobin

of the body is present as circulating haemoglobin It might be expected, therefore, that a state of iron deficiency would manifest itself as a deficiency of haemoglobin and that chronic loss of blood would seriously deplete the body s stores of iron Actually the character of the blood picture in hypochromic anaemia with its low colour index and its low mean corpuscular haemoglobin concentration suggests that the essential fault is a failure of the erythron to produce haemoglobin for the developing red cells, and this blood picture is always associated with conditions which deplete the body of iron The menstrual drain of blood accounts partly for the preponderance of females which is observed clinically In men hypochromic anaemia is often associated with chronic blood loss from haemorrhoids

The supply of iron in the food is very small, and of this only a part is available (Elvehjem, 1932 , Widdowson and McCance, 1936), so it is not surprising to find dietary deficiency frequently associated with hypochromic anaemia (Davidson, Fullerton, *et al* , 1933 , Heath, 1933) There is evidence that iron is better utilized when administered to patients with a normal gastric secretion (Heath 1933 , Minot and Heath, 1932) or in an acid buffered medium (Mettier and Minot, 1931) and these observations fit in with the high incidence of achlorhydria or hypochlorhydria among cases of hypochromic anaemia The role of pregnancy in producing hypochromic anaemia can be attributed partly to the drain of iron into the foetus and in lactation, not fully compensated for by the omission of menstruation, and partly to the temporary hypochlorhydria (Strauss and Castle 1932)

In short the repeated association of hypochromic anaemia with conditions which would be expected to lead to iron deficiency and the specific cure of the anaemia with iron strongly favour the view that the hypochromic anaemias are conditioned by a state of iron deficiency in the body

Dose in Relation to Iron Need

A rise of 1 per cent per day in the circulating haemoglobin represents the addition of only 23 milligrammes (1/3 grain) of metallic iron per day to the circulation If the mode of action of iron is simply to correct the iron deficiency in the body it is difficult to explain why large doses are required The discrepancy between iron need in the body and the size of the average optimum dose led Schulten (1930) to reject the view (Fullerton 1934 Heath, Strauss and Castle 1932) that iron therapy was effective by virtue of correcting a deficiency He quoted the possibility of a catalytic (*fermentartigen*) action although admitting that this explained nothing and appeared to lean towards the explanation attributed to Elvehjem (Dameshek 1934) that the large doses were effective in virtue of their supplying by contamination another haemopoietic factor such as copper

Heath, Strauss, and Castle (1932), however, showed on a number of cases of hypochromic anaemia treated by injections of iron that the iron content of the haemoglobin formed as a result of treatment was roughly equal to the amount of iron injected or in other words that the utilization of injected iron was 100 per cent This has been taken (Fullerton 1934) as establishing the view that the hypochromic anaemias are conditioned solely by a state of iron deficiency and that iron therapy acts solely in virtue of rectifying a state of iron deficiency This assumption is not necessarily justified for the cases observed by Heath Strauss, and Castle were not treated throughout the whole recovery period by iron injections and even in the short periods of observation there were significant variations from 100 per cent utilization Moreover, it leads to the conclusion that iron and ammonium citrate and Blaud s pill in the average optimum doses are very poorly absorbed from the intestine (Clark, 1932) Brock and Hunter (1937) have recently demonstrated that these iron preparations are very well absorbed, and have shown how big is the discrepancy between retention and utilization

This latter work has therefore raised again the question, apparently settled by the work of Heath Strauss and Castle why it is necessary to give large doses of iron If the hypochromic anaemias are conditioned solely by a state of iron deficiency and iron therapy is effective in virtue of correcting this deficiency why is it necessary to give doses of iron which lead to the accumulation in the body of a great excess of iron? Why are smaller doses not effective?

Iron Retention and Iron Utilization

In considering the response of the blood to iron reaching the body via the intestine in patients with hypochromic anaemia three selected cases are described because they illustrate different forms of response The cases are selected from a small series in which the amount of iron retained as a result of a short period of therapy was measured by balance experiments (Brock and Hunter 1937) and the resultant haemoglobin rise measured The further course of the patients was observed over a period of two years or more Haemoglobin was estimated by the Haldane method, using a calibrated standard on which 100 per cent represented 13 8 grammes of haemoglobin per 100 c cm of blood The iron content or iron

Clinical Memoranda

Two Unusual Deaths

The two cases reported below appear to have unusual features which may be of some medico-legal interest I am indebted to the coroner for Derby, Captain T H Bishop, for permission to publish them

A FAILED SUICIDE

"I respectfully beg to report that at 3 p m December 18, 1936, I received information that X, aged 48 years, textile manufacturer had committed suicide by poisoning He had become depressed of late owing to pains in the head and business worries" So ran the police report

X had left for work by car at 8 30 a m, and at 11 45 a m his wife had found him lying in the porchway in an exhausted condition A note in his handwriting found in the garage said "Children, be good to your mother, as she has been an angel to me Goodbye God bless you all To know all is to forgive all, no mourning for me, a failure" A jar of creosote was found near the note and it was assumed he had taken some

At the post-mortem examination it was noted that there was cyanosis of the head, neck, and extremities, but no oedema The mouth, oesophagus, stomach, and intestines were all normal, there was nothing in any way suggestive of poisoning by creosote The stomach, with its content of about half an ounce of pink and somewhat frothy mucus was placed in a jar and sent for analysis for poisons The analyst (Miss M Staynes) later reported that an examination for all types of poison had been negative The heart weighed 15 oz The tricuspid orifice admitted four fingers with ease, but the mitral orifice was so stenosed that it would not admit one finger readily He had a typical old rheumatic mitral stenosis The aortic and pulmonary valves were normal The coronaries showed advanced arteriosclerosis with calcification The blood generally was dark and fluid There was some pulmonary oedema The liver was but little enlarged Death had been due to cardiac failure secondary to mitral stenosis and arteriosclerosis

Apparently it is not even given to suicides to determine the manner of their death in all cases It is well known that slightly more than one-tenth of people who attempt to commit suicide by drowning die of heart failure before it is possible for them to drown But such people are not commonly given a certificate of death from natural causes because the suicidal act had commenced Similarly the usual cause of death after criminal abortion is sepsis, but death from syncope during the act of procuring the abortion has been recorded Such a death is not due to natural causes but to murder The present case is of great interest because there can be little doubt that the untimely intervention of heart failure prevented suicide The circumstances point strongly to the suicidal intent Evidently the excitement associated with this was enough to bring about the failure of the hypertrophied heart, which was labouring under the double disability of mitral stenosis and coronary sclerosis The coroner gave a certificate of death from natural causes, which was obviously correct but had X been heading for the river instead of the poison then—at least the fears of some ecclesiastics about burials in hallowed ground do seem like hair splitting

A PECULIAR DROWNING

A few days after the case reported above I made a necropsy on the body of a girl of 4 months

About half an hour before death she had had a drink of milk and was playing on a sofa while her parents had their dinner Suddenly she threw up her arms and went black The parents picked her up and rushed her out They evidently had no idea of suitable treatment, and the girl died immediately By the time their doctor arrived she was beyond all aid The baby was a splendid physical specimen and had had no sicknesses during her life

On opening the thorax the lungs did not collapse at all Milk curds exactly similar to those in the stomach were found the whole way down the trachea and larger bronchi, which also contained a very small amount of blood stained froth Both lungs were "waterlogged" and retained the impression of a finger The stomach contained a large quantity of curdled milk and mucus The blood generally was dark and fluid Previous to this incident all the organs had been perfectly normal

The parents' story was thus confirmed by the post mortem examination After a hearty meal the baby had inhaled its vomitus and drowned This is fortunately a rare, but by no means unknown, mode of death

G R OSBORN, M B, B S,
Derby Pathologist, Derbyshire Royal Infirmary

Treatment of Repeated Abortion

Since evidence of the possibility of treating sterility referable to endocrine inadequacy is at present of general interest, it seems worth while to report a repetition of success in securing pregnancy in the patient who was the subject of a note published in this *Journal* on June 22, 1935

The child born in November, 1934, was weaned at 4½ months, and has thriven The mother suffered somewhat during 1935 from asthenia and remained underweight The menses needed regulation by prolan and calcium gluconate from October onwards Improvement resulted, and contraceptive precautions were dropped Pregnancy followed in January, 1936 Professor Crew kindly carried out an Aschheim-Zondek test on March 26, and reported the result "a definite positive" A 1 in 10 dilution gave one mouse negative, one positive, 1 in 100 was negative These findings corresponded with the results of clinical examination, and suggested a normal pregnancy of two months duration This was a much more favourable report than that on the Aschheim-Zondek on the previous pregnancy, possibly ascribable to the use of prolan for three months preceding conception

It was decided to take no risks, so antuitrin S (1 c.cm) every other day was given for three months, then reduced to twice weekly for two months, then omitted for the eighth and ninth Wheat-germ oil was taken throughout also calcium gluconate and glucose D with insulin The patient's general condition was above her average, partly due no doubt to confidence in the outcome of the pregnancy On October 6 a breech presentation was corrected by abdominal manipulation Labour began at 4 a m on October 13, and delivery was effected spontaneously at 9 15 a m The baby weighed 7½ lb, and was well formed and healthy The placenta was normal, quite unlike that of the miscarriage four years earlier, in which the villi were cystic and the decidual cells degenerate Successful lactation followed

It seems possible that less active treatment might have sufficed, but we lack knowledge of exactly where to stop with safety, quantitative estimations of the prolan content in pregnancy urine being still an uncertain guide In another case, a patient who had previously had several miscarriages maintained a pregnancy up to the seventh month, when injections of antuitrin S were stopped Miscarriage followed within a fortnight

I have also thought hormone substitution treatment of minor symptoms such as headache, muscular asthenia etc, of value in pregnancy, using the smallest possible doses

LILIAS M BLACKETT JEFFRIES,
Hove M D, B S Lond

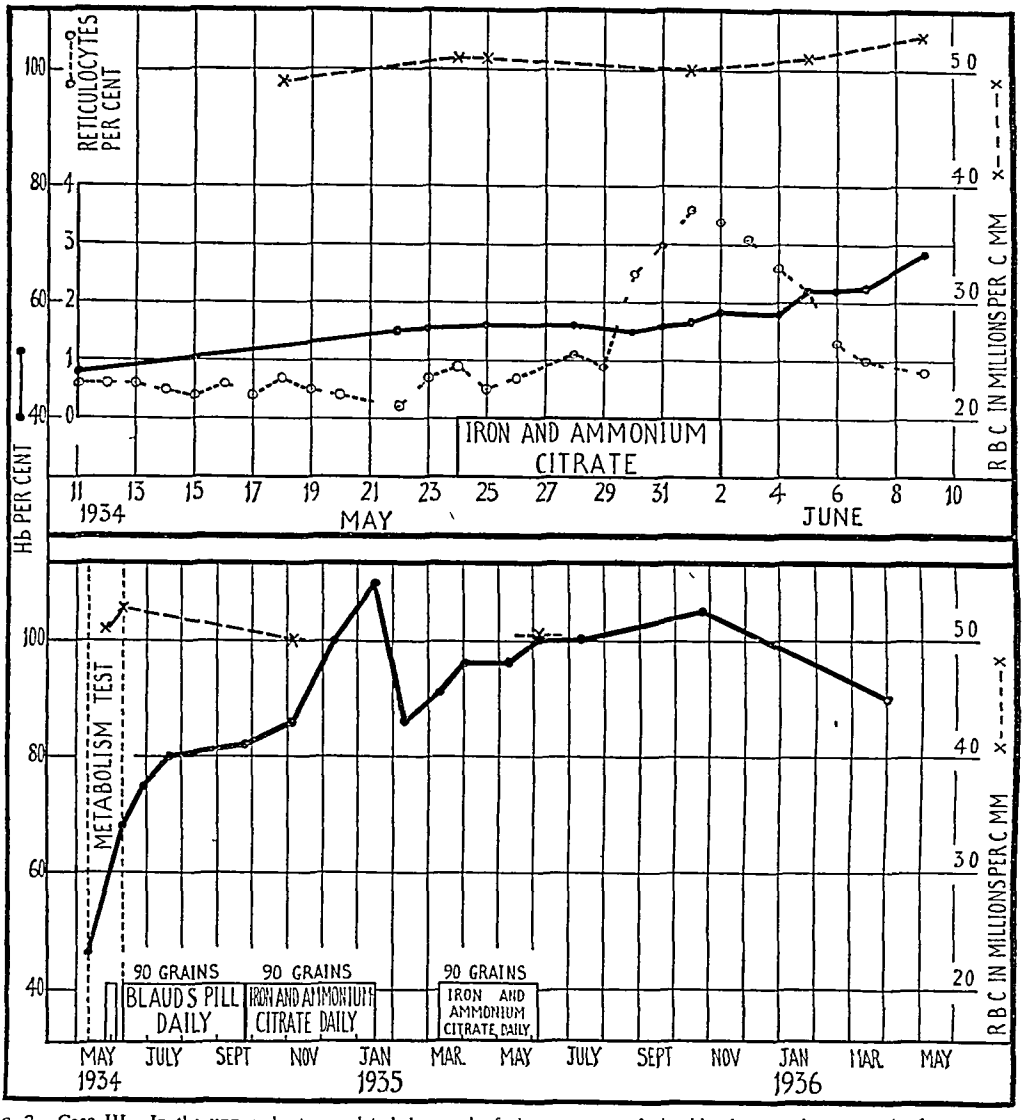

FIG 2.—Case III. In the upper chart is a detailed record of the response of the blood to a short period of treatment. In the lower chart the patient's subsequent progress is recorded is condensed on to a smaller scale between the dotted lines. In the lower chart the period of time recorded in the upper chart May 23–June 9, was 13 per cent. representing 300 mg. of iron. Iron retention May 24–June 2 was 1 665 mg. Haemoglobin rise

c.mm. haemoglobin 45 per cent., white blood count 3 800 per c.mm. She was given Blaud's mass in gelatin capsules 102 grains a day for six days and 153 grains a day for a further three days. As a result of this she retained 2 491 mg. of iron or more than is contained in the whole circulating haemoglobin. The resultant rise of 29 per cent. in the haemoglobin (Fig. 1) represented the addition of 644 mg. of iron to a 5 litre circulation. When iron therapy was renewed the haemoglobin continued to rise and reached 100 per cent.

Case III

The patient—a case of idiopathic hypochromic anaemia resistant to iron therapy—was a female aged 38 single. Lassitude, pallor and shortness of breath for two years. Finger nails brittle. No serious illness in the past. Diet moderately satisfactory. No indigestion. Catamenia not excessive. On examination well nourished, pale with bluish sclerotics, koilonychia. Slight marginal atrophy of mucous membrane of tongue. No temperature. No septic foci. No haemorrhoids. All other systems normal to clinical examination. X ray examination showed no abnormality in stomach or duodenum. Fractional test meal: no free hydrochloric acid after gruel meal repeated with histamine—free hydrochloric acid 0.15 per cent., total acid 30. No occult blood in stools. Red cells 4 900 000 per c.mm., haemoglobin 55 per cent., colour index 0.56, white cells 5 500 per c.mm. Urine and renal function normal.

Details of her blood are given in Fig. 2. She took 90 grains a day of iron and ammonium citrate for nine days. Of this she retained 1 665 mg. At the end of sixteen days her haemoglobin had only risen 13 per cent., representing the addition of 299 mg. of iron to a 5 litre circulation. She was put on to 90 grains a day of Blaud's pill but at the end of four months her haemoglobin was only 80 per cent. If only 5 per cent. of the Blaud's pill had been retained an improbably low estimate (Brock and Hunter, 1937) she would still have retained another 3 grammes in addition to the 1.66 grammes retained in the experimental period. This is twice as much

the development of colloidal chemistry referred to above has been to divert attention from the more complex systems to the simpler ones, whose behaviour can be more easily analysed Hence Dr von Buzagh describes the properties of dusts, smokes, and inorganic emulsions in preference to the properties of protoplasm, and the information of immediate interest to the biological sciences in this textbook is less than was contained in similar works a decade ago[4] A phase of this character is obviously essential to the development of colloidal chemistry and will ultimately prove of great service to biology, because the chief hope for the elucidation of the properties of living matter lies in the increase of fundamental knowledge about the properties of matter dispersed in colloidal dimensions

RADIOLOGY OF THE DIGESTIVE TRACT

The Digestive Tract A Radiological Study of its Anatomy Physiology and Pathology By Alfred E Barclay, O B E, M A, M D, D M R and E, M R C P Second edition (Pp 427, 296 figures 36s net) London Cambridge University Press 1936

In 1933 we welcomed Dr Barclay's book on his radiological studies of the anatomy, physiology, and pathology of the digestive tract for the individualistic and broad-minded way in which it was compiled In the second revised edition he has amplified and rewritten much of the work, which is distinguished throughout by being a record of his personal experiences His own observations and what he has learned from others are blended in a philosophic way into a readable and instructive book All the background of the radiologist's work, the installation and management of his apparatus, the protection of himself, his patient, and his assistants from possible risks, the technique of screening and radiography are capably dealt with Dr Barclay has correlated the accepted views on the anatomy of the digestive organs with results obtained by x-ray examination after giving barium or dyes to distend and define the hollow viscera In this way he has made independent researches on the physiology of the act of swallowing He now insists even more emphatically than before on the absence of any symptoms that could be found to arise from mere change of position of the stomach and colon Filling and tone are physiological variations, but position, with its so-called kinks of intestine, the author regards as within physiological limits and as offering no cause for apparent delay or indication for surgical intervention

Dr Barclay's individualistic method leads him to difficulty in accepting the rather widely established views on the importance of laying stress on the pictures of rugae or striae caused by mucous membrane folds in the filling or emptying stomach Much of the recent work, it must be recognized is established on the correlation of the x ray picture with views of the stomach lining obtained directly by means of the gastroscope, and confirmed by macroscopic and microscopical specimens removed at operation and fixed at once Dr Barclay insists on the value of interpreting variations in the course of peristaltic waves on the contour of the stomach, and gives insufficient weight to the appearances of the lining of the stomach Nor does he bring into his illustrations instances of these appearances with modern technique, although the diagnosis of two ulcers of the four on page 234 is based on this principle It may be that too much emphasis is at present being laid on evidences of gastritis, but we feel that as things are now a more judicious attitude may be advisable rather than dismissing the subject in a couple of pages The chapter on gastric ulcer gives a good description of the subject, but many of the radiographs submitted as illustrations are less good than can be got by modern technique This criticism applies to the chapter on the colon and elsewhere, but duodenal ulcer is beautifully illustrated The diaphragm is briefly described, but diaphragmatic hernia, and especially the relation of congenital short oesophagus and hernia of the cardiac end of the stomach, are not clearly put before the reader

Dr Barclay's book is so good that we hope, when there is the call for another edition, that the whole may be brought up to the standard of the best, which is indeed a high one

CORRECTION OF SQUINT

Squint Training By M A Pugh, M R C S (Pp 117, 42 figures 7s 6d net) London Humphrey Milford, Oxford University Press 1936

The progressive employment of the methods of training of squinters which were so systematically and usefully developed by the late Claud Worth has brought into being quite a library of books on the subject Of these the latest is by the medical officer to the orthoptic department of Moorfields Eye Hospital The opportunities for observation and assessment of results presented by such a department can be second to none

Dr Muriel Pugh gives the results of the primary causes which enable some grouping to be made of squinters Of one thousand cases 10 per cent were due to physical defects either in the muscles or in the eyes These are obviously the most difficult cases to deal with If there is serious eye defect then no treatment can be effective, if there is muscle defect no training can avail until the surgeon has adjusted the muscle so far as this can be done The second group, including some 50 per cent, is that in which there is more or less error of refraction, and in which the provision of glasses exerts a favourable influence upon the angle of the squint In these cases the object of training is to re-establish a normal convergence-accommodation link when the ametropia has been corrected by suitable glasses Cases of this group react very well to exercises, they are those which are the least difficult to treat Both glasses and exercise are necessary for success

The third group, of about 20 per cent of the total, are those whose squint is due to fusion defect Whereas those of the second group may have initial symptoms of diplopia such symptoms are not found in these children They are particularly liable to develop "false projection" This bad habit has to be suppressed, as well as the normal habit developed, so that the length of time and amount of work necessary for a successful result is much greater in this group than in the former, but normal binocular vision can be restored in a large proportion of cases if enough patience be expended The fourth group, of another 20 per cent, are the "psychological squints," a type that has been emphasized by Inman Of all the queer reactions of human nature, and of innocent infantile human nature, one of the queerest is the production of a squint because a new baby has arrived in the family The elder child mopes then squints, especially when it looks at the baby No wonder our forefathers thought a squint was the evil eye! Left-handedness and stammering is common in this group The treatment is more psychological than orthoptic

In succeeding chapters the author develops the whole technique of training and its adaptation to the different classes of cases She is able to set out the facts with clearness and with a minimum of that kind of technical verbiage which is more clogging than liberating She has done her work well, and it will be of lasting value to many colleagues

TREATMENT OF GONORRHOEA WITH A SPECIFIC ANTITOXIN

BY

T ANWYL-DAVIES, M D, B S, M R C P
Director of the Venereal Diseases Department and Lecturer at St Thomas's Hospital

Since the earliest days of medical therapy it is no exaggeration to say that the world has awaited a specific remedy for the treatment of gonorrhoea All attempts to discover a drug having a specific action, either direct or indirect, upon the gonococcus have failed, and the biological remedies hitherto produced have been equally ineffective

Urged by Professor E Mellanby at the beginning of February, 1934, to investigate a new biological approach in conjunction with Dr Mervyn Gordon, our researches were then directed towards the production of a gonococcal antitoxic serum along the lines which had proved so successful in Gordon's hands for the preparation of antimeningococcus serum The two organisms have many points in common Although their cultural characteristics and pathogenicity to animals are distinctly different, the meningococcus and the gonococcus resemble each other in their microscopical appearance, the negative reaction to Gram's stain their intracellular habitat within the leucocytes, and the agglutination by identical specific sera the absorption test being necessary to distinguish them

Earlier Work

Serum treatment in gonorrhoea is not new Previous work on these lines however, has been confined almost entirely to the use of anti bacterial sera prepared by immunizing animals with cultures of the living organism The position was well summed up by Minet and Debains (1923) at the Congress of Urology that unfortunately, we know little about gonococcal toxin, and we do not know yet how to prepare an exclusively antitoxic serum —we are only aware of an anti microbic serum, prepared at the Pasteur Institute by M Nicolle ' Clinical reports have shown that such a serum is helpful, but that it falls far short of being a specific remedy Our investigations had not proceeded very far when our attention was drawn to the successful results obtained by Dr N S Ferry (of the Parke Davis Research Laboratories, U S A) in the production of a soluble toxin from the gonococcus by a method he had used in the preparation of a meningococcal toxin Ferry with Clark and Steele, had published a paper on the properties of a bouillon filtrate of the gonococcus After reviewing previous works on the subject the most important of which would appear to be the development of sera by de Christmas (1897), Herrold (1925), Herrold and Traut (1927) and Herrold and Hoffman (1930) *the authors describe the method evolved* in producing the filtrate and express the view that it exhibited properties which seemed to characterize it as an extracellular toxin It was found that the toxin was capable of producing skin reactions similar to the Dick reaction in dilutions of 1 in 1 000 and 1 in 1 500 Furthermore, the injection of animals with this toxin stimulated the formation of an antitoxin which neutralized *in vitro* as well as *in vivo* Repeated subcutaneous injections of increasing doses of filtrate stimulated the formation of antisera with properties unmistakably antitoxic in nature a characteristic which was evidenced by the fact that antisera prepared from both rabbit and horse neutralized the toxic properties of the filtrate

Sensible of the possible advances to be achieved by the use of such a soluble gonococcal toxin for the production of an antitoxin to be used in the treatment of gonorrhoea, Parke Davis and Co were approached through Dr Stanley White, their medical representative in this country, in regard to the preparation of a gonococcus antitoxin for clinical trial Using a method practically identical with that devised by him for the production and standardization of meningococcus antitoxin, Dr Ferry prepared an unconcentrated gonococcus antitoxin *This was later* concentrated by the Banzhaf method which leaves the antitoxic potency in the pseudo globulin fraction, a point which Ferry considers supports the evidence in favour of the product being a true antitoxin

The antitoxin was placed in my hands by the courtesy of Parke, Davis and Co through the kindness of Dr White to whom I am also indebted for assistance not only on the laboratory side, but also in the subsequent clinical investigation

Preliminary Trials

Initial trials were made with an unconcentrated antitoxin on complicated cases, both acute and chronic, chosen for their severity as being a more rigorous test As the dosage and reaction were unknown its use was restricted to in patients It was at once noticed that the antitoxin appeared to be exerting a specific effect The average daily dose of this unconcentrated antitoxin was found to be 5 to 20 c cm when injected intramuscularly Even with these small doses caution was necessary as in some cases severe reactions occurred The beneficial results, however, were beyond question, and it was found possible, even after severe reactions, to repeat the injection twenty-four or forty eight hours later

After these preliminary trials a request was made for a concentrated antitoxin from which much of the extraneous protein had been removed This was kindly supplied to me with the information that theoretically it should prove five times more potent than the unconcentrated product In practice this proved to be the case In no instance was it necessary to administer more than 8 c cm of this concentrated preparation at one time and in most cases 5 c cm appears to constitute a maximum dose The average dose was found to be 1 c cm intramuscularly, doses of over 2 c cm in many cases caused severe systemic disturbance Later a routine procedure *was adopted of injecting adrenaline simultaneously and* mixed with the antitoxin It appears advantageous to inject the adrenaline with the serum rather than to administer it separately Three minims of adrenaline chloride solution 1 in 1 000 were given with 1 c cm of the concentrated antitoxin four minims with 2 c cm and five minims with 3 c cm In this way the reactions have been controlled to such an extent that it has been possible to treat out patients with this concentrated antitoxin

A surprising feature was the comparatively small amount of antitoxin necessary particularly when one considers the comparatively large doses of meningococcus antitoxin which are essential to combat meningococcal infections until Gordon suggested that almost certainly both an active and a passive immunity were being obtained

The question of a reaction attributable to some reason other than a specific effect such as the protein content of the serum was investigated To obtain satisfaction on this point a series of controls with normal horse serum was carried out In no instance had the serum any influence on the infection or the patient neither did it cause reactions of any kind, nor was temperature or respiration disturbed

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY FEBRUARY 13 1937

PHYSICAL EDUCATION: THE GOVERNMENT'S SCHEME

Through the publication of the reports of its committees on nutrition and physical education the British Medical Association has taken the lead in stimulating a widespread interest in the improvement of the national health and physique Whether the full value of these reports has received official acknowledgement may perhaps be doubted In the Government's White Paper on physical training and recreation, details of which are given elsewhere in this issue (p 342), there is but a single reference to the Association's Committee on Physical Education, and the reference is one which might lead the reader to suppose that this committee did no more than "endorse" the policy outlined in Circular 1445 issued by the Board of Education in January of last year In fact the Association's committee made many original recommendations one of which, relating to the provision of suitable clothing and shoes for gymnastics in schools, has since been "endorsed" by the Board

The White Paper issued this week (Cmd 5364) deals primarily with the development and extension of the facilities available for persons no longer attending school This subject which had been mentioned briefly in Circular 1445 was discussed at length in the report of the B M A Physical Education Committee[1], and it may perhaps be assumed that the work of the committee has contributed usefully to the shaping of the Government's proposals Certainly these proposals include much that the committee recommended and nothing that conflicts with its suggestions Entirely in accord with the views of the Association's committee are the decisions of the Government on the three fundamental questions of policy discussed in the White Paper the scheme is to be a voluntary one, it is to be built up by extension of the work of existing agencies and it is to include not only formal exercises but also various physical activities of a recreative character As to the wisdom of these decisions there will be general agreement

The detailed proposals include provision for additional gymnasia and gymnastic equipment with changing-rooms and shower baths, for an extension of the existing facilities for outdoor games swimming, and other forms of physical recreation and for the supply of an adequate number of suitably trained teachers and leaders Attention is to be paid also to publicity and propaganda The plan entails co operation, central and local between public bodies and voluntary organizations In important ways it extends the powers of local authorities, in particular, it enables local education authorities to provide facilities for persons over 18 years of age who are not attending educational institutions In making this last provision the Government has adopted a suggestion originally put forward by the Association's committee But, indeed practically all the above-mentioned features of the scheme are to be found among the committee's recommendations

Circular 1445 of the Board of Education concluded with these words "The Board desire to impress upon authorities the importance of developing their arrangements for physical education and to express the hope that they will co-operate cordially with voluntary organizations in providing facilities for young people no longer at school The foundations for a complete and efficient system of physical education have been laid it is now the task of authorities, teachers and voluntary organizations throughout the country to build upon those foundations a complete structure, which will be of inestimable value in the development of a healthy, happy, and vigorous community How this task was to be accomplished without an improved organization and an increased supply of funds was not clear to the Association's committee, which therefore recommended that "schemes for the promotion of physical education in the community as a whole should be provided with a permanent administration and be guaranteed adequate financial support" The Government now acknowledges that "without some measure of central co-ordination of effort the provision must necessarily be sporadic and incomplete and that "the funds available from all sources are insufficient to cover the ground as fully as is needed The measures which have been devised to meet this double need are described on another page The adequacy of the proposed financial provision remains to be seen, the administrative machinery is well conceived, and should prove eminently workable

Of particular interest to the medical profession is the statement that the proposed National College of Physical Training will include among its activities the investigation of problems connected with the physiology of physical training The British Medical Association's committee strongly recom

[1] *British Medical Journal Supplement* April 18 1936 reprinted as a pamphlet price 6d

completely even those which temporarily relapsed No disability or ankylosis remained in any single case

Three acute cases relapsed The first an acute arthritis of the left knee improved but relapsed four weeks after 6 c cm (1 2 and 3 c cm) of the concentrated serum The second a severe polyarticular case in which both ankles wrists and the right knee were involved improved temporarily with 6 c cm (1 2 and 3 c cm) *of concentrated serum but four* weeks later a slight effusion returned in the knee joint although the other joints had recovered The third an acute urethritis of three weeks duration had an effusion in both wrists and knee-joints Initial improvement followed 20 c cm (2 3 5 and 10 c cm) of the unconcentrated serum, but the fluid returned in the left wrist ten days after the last injection The focus was in the right vesicle

One chronic case of seventeen years duration relapsed It was particularly severe, being complicated by an acute epididymo orchitis iritis bilateral vesiculitis and prostatitis Two months after 78 c cm of the unconcentrated antitoxin had been given an effusion developed in the knee joint After a second series of injections (20 c cm) no relapse occurred over a period of nine months observation

Reactions

No fatality has occurred among the cases treated All the reactions of whatever type and degree of severity have been transient and left no permanent disability Provided the dosage does not exceed 15 to 20 c cm in the case of unconcentrated antitoxin and 3 to 4 c cm in the case of the concentrated antitoxin the reactions are not alarming or more marked than those caused by the sera commonly used in other infections

Urticarial serum rashes develop earlier with the concentrated than with the unconcentrated antitoxin generally within three days after the last injection, instead of within four to ten days with the unconcentrated preparation With the concentrated product the rash is more transient and generally localized to the buttocks With the unconcentrated *serum the rash has been more generalized* about the trunk and limbs and takes longer to disappear

The duration of the rash with the unconcentrated product was as follows in two patients one day in one *patient two days in one patient, three days in three* patients four days in three *patients five days and in* one patient six days In four patients the rash developed one day after the last injection, in three cases, two days in nine cases three days, in two cases four days in three cases five days, in one case, seven days, and in one case ten days In ten cases the rash appeared on the buttocks

Serum sickness occurred in five cases, two of these had no other signs of a serum reaction Stiffness in the shoulders headache, rigors, pain in the back and joints or in the limbs were also reported 'Thermal reactions due to the serum were also experienced in fourteen patients in a series of 112 cases Two developed a sore throat with an accompanying pyrexia of 103 6 in one case and 103 in the other In both cases the pyrexia and sore throat had subsided within twenty-four to forty-eight hours and were not septic in character

Apart from the customary reactions already enumerated certain additional phenomena, including some types of pyrexia to be mentioned later provide additional evidence of specific action A period of approximately five hours after an injection seems of peculiar significance in all types of case both acute and chronic About this time the following phenomena have been experienced by different patients sudden cessation of pain, collapsed feeling rapid pulse and pyrexia, rigors profuse perspiration transien nausea and faintness

At this time one case of salpingitis with a temperature of 102 2 felt as if she had been doped ' and then lapsed *into* a deep sleep When she woke ten hours later both pain and pyrexia were absent and remained so Another patient with a gonococcal septicaemia and a bilateral salpingitis had a sudden rise of temperature from 101 to 104 during this five hour period Then she complained of pains in the body and limbs, and became delirious for three hours

One out patient with acute uncomplicated urethritis who had received 1 c cm of the concentrated antitoxin daily for seven days on the eighth day experienced a mild rigor which was followed directly after by a profuse macular rash covering both legs up to the knee joint Independent observers agreed that this was not a typical serum rash it had no urticarial characteristics and did not irritate The only possible conclusion was that the patient was experiencing a gonococcal skin reaction which, although rare has been noted by me on occasion This again is supportive evidence that the antitoxin has a specific effect Incidentally before this occurred all signs and symptoms of a gonococcal infection had disappeared

Pyrexia

Analysis of the temperature charts of sixty in patients *separates naturally into three groups, two types of* pyrexia confirming the specific reaction of the antitoxin, and a third apyrexial class

(*a*) A specific pyrexial reaction rising progressively (Fig 1) as the injections proceed but dropping to normal directly

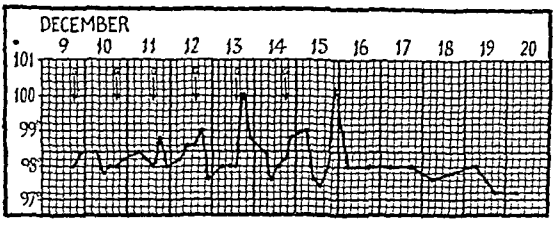

FIG 1 —An uncomplicated gonococcal urethritis
G = Gonococcus antitoxin 2 c cm

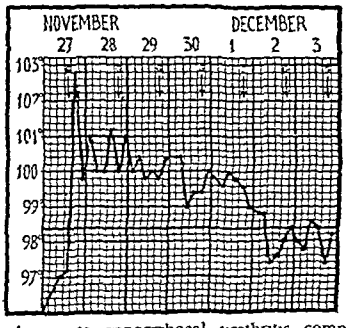

FIG 2 —An acute gonorrhoeal urethritis complicated by prostatitis a right sided vesiculitis and a right sided epididymo-orchitis
G = Gonococcus antitoxin 2 c cm

the administration of the antitoxin ceases and remaining normal (except for serum thermal reactions) occurred in forty four patients

(*b*) A specific pyrexia falling (Fig 2) after the first injection gradually and progressively as the injections proceed to normal and remaining normal (except for serum thermal reactions) occurred in twelve cases

(*c*) The temperature remained normal during the administration of the injections in four cases

At this point the cause of these reactions may be discussed Several possibilities emerge One that the gono-

A DIETARY SURVEY

The report on a dietary survey in terms of the actual foodstuffs consumed, by Professor E P Cathcart and Mrs A M T Williams, recently issued by the Medical Research Council,[1] is a document that repays close study It contains some information that is astonishing and whets the desire for knowledge regarding the state of health of those whose diets are low in the so called "protective" foodstuffs knowledge which it is to be hoped, the Medical Research Council may soon be in a position to provide

"In the present report the authors bring together the figures obtained in their earlier investigations made at St Andrews, Cardiff, and Reading, and analyse them from a new angle In the earlier reports attention was in the main directed to the nature of the food consumption in terms of protein, fat, and carbohydrate, irrespective of the sources from which these principles were derived In the present report these data have been interpreted in terms of some of the principal foodstuffs purchased in the course of everyday house-keeping The results of studies of the type of food eaten by a number of Glasgow families, and also by some women students, have been added to those obtained in the other localities Thus it is evident that a view of the actual foods eaten by a fairly large section of the population has been obtained in this work"

This view is given in the form of summaries of the foodstuffs consumed by the families in their various social and other groupings It is a view of the average diet in each group, but one showing little or no detail of the diets falling below the average We read that "few of these diets from the standpoint of energy, protein and fat content, percentage of 'first-class' protein, and mineral salts can be regarded as really poor, far less hopelessly inadequate, but at the same time many of them, particularly with reference to their content of 'protective' foodstuffs like milk, green food, and fruit leave much to be desired" We are told of families in Glasgow whose intake of calcium per man per day is as low as 0 28 to 0 34 gramme of phosphorus as low as 1 gramme, and of iron as low as 10 milligrammes, and we wonder what the state of health of the women and children of these families is We learn that the daily intake of calcium by a group of apparently healthy women students showed individual variations ranging between the high figure of 1 974 grammes and the low one of 0 257 gramme and curiosity is aroused as to how a woman whose diet provided less than one third of a gramme of calcium daily would react to the strain of pregnancy or of influenza Searching through the tables giving summaries of the foodstuffs consumed by the unemployed and by the unskilled workers we are left with the impression that the diets of some families in these groupings must be very low in fat-soluble vitamins Of fifty-three families, drawn mainly from the less well-paid section of the inhabitants consuming on the average 3,096 Calories per man per day no less than 1,986, or 64 per cent, of Calories were derived from foodstuffs—meat, bread, and sugar—poor or completely lacking in vitamin B_1 We wonder what effect the low intake of vitamins is having on the children of these families We learn that comparatively little use is made of such excellent foodstuffs as legumes, skimmed milk, butter-milk and cheese, that the consumption of sugar is high, and that the use of brown bread is an evidence of social status We read that the weekly expenditure on food per man of the unemployed class in St Andrews is 6s 2d, with a standard deviation of 1s 4d, and we wonder how the diet of a family spending the sum of 4s 10d per man per week is constituted

The authors consider that the usual allowance of 10 per cent for refuse and waste is much too high, that 5 per cent is nearer the mark, and that even this is on the high side Though poverty is to-day commonly regarded as the primary cause of inadequate nourishment, they are of opinion that "the main causal factor of inadequate diets in many households is ignorance of how to buy what to buy, and how to use to the best advantage the material bought" This is, of course not to say that lack of means plays no part, "such an assertion would be merely futile" A large percentage, we are told, tend to purchase items of a luxury nature rather than those of an essential type "Too often there is an excessive expenditure at the beginning of the week on tasty foodstuffs that give a poor return per penny spent and a period of bare maintenance later Balance of expenditure is an art unknown or ignored by many' The authors express regret that such a state of affairs should exist in a country like ours and ask the question How can things be improved? They do not believe the difficulty to be solely of an economic nature, "the problem is far more complicated than some would-be reformers imagine" They disagree with "those who imagine that they can alter the dietary habits of our people by direction or dictation It is not dictation but education which is required" They conclude a most interesting instructive, stimulating and curiosity-exciting report with the words "The fact remains that although improved economic conditions may play a part in the amelioration of diets the greater universal good will be attained by educational means"

OUTBREAK OF FOOD POISONING IN AN INSTITUTION

BY

A R CULLEY, M D, D P H

Medical Officer of Health County of the Borough of Carmarthen

In spite of the number of outbreaks of food poisoning well recorded I feel that it would be of use to the profession if these outbreaks were more often described Much attention has been given to the problems of food poisoning in several countries in this country particularly, by W G Savage and P Bruce White, and their *Food Poisoning A Study of 100 Recent Outbreaks* (Special Report Series No 92 Medical Research Council) should be in the possession of every medical officer of health The outbreak to be described occurred at a mental hospital with 763 inmates

Onset of the Outbreak

On September 23, 1936 I was informed by the medical superintendent that several patients were ill, one desperately so with vomiting or diarrhoea or both, and that food poisoning was suspected Fifteen patients were found to be ill, and the clinical picture was severe headache, vomiting, diarrhoea, muscular pains and temperatures varying from 100 to 103° F The vomit was greenish and the diarrhoea a pale brown loose stool Muscular pains were complained of chiefly in the legs The onset of similar symptoms in so many people distributed on the male and female sides of the institution which are fairly isolated from each other with more of the staff affected, strongly suggested that infected food was the causal factor

The dietary was inspected and the foods suspected were breakfast sausage canned mutton, and possibly milk The milk was supplied from the institution's farm and had been taken in all the wards and the hospital block Some wards and the hospital block had no persons ill with the same symptoms as described above, so milk was not further considered The breakfast sausage had been introduced for breakfast (about 9 a m) on September 20 and the canned mutton was used for dinner, at 12 30 p m on September 21 The breakfast sausage had been satisfactory, but four of the patients now ill had not partaken of the sausage and these four patients were in different wards It was noted that everyone who was ill had taken the canned mutton There was no sausage left for bacteriological examination

The mutton was canned in the Argentine, and was supplied in 6 lb tins Twenty-seven tins were opened in a larder by the storekeeper at 11 a m on September 21 and were taken directly into the kitchen where they were divided into slabs for further slicing in the wards The storekeeper noted one blown tin, which he opened after the mutton from the apparently good tins had been delivered to the kitchens The mutton in this tin was in a state of decomposition, and was destroyed in a furnace The empty tin was sent for bacteriological examination The rest of the mutton appeared wholesome and was eaten without any complaint It was served untreated

The Investigation

A few patients assist the kitchen staff, and on inquiry it was established that among the staff or patients in the kitchen none had had any recent suspicious illness The kitchens were clean, but it was noted that there was a water closet in a room opening directly into the kitchen The temperature of the kitchen was not taken, but the rooms were definitely warm

Every inmate who became unwell was regarded as suffering from food poisoning and the number amounted to thirty one The shortest incubation period was fifteen hours and the longest seventy two hours average period for males, twenty five hours, for females, thirty-four hours During convalescence bradycardia was a feature Two male patients died, one after being ill forty-two hours and the other after between forty eight and seventy-two hours illness An attempt was made by the Welsh Board of Health to discover if any other persons in the country were infected from the same consignment but without success

NECROPSIES

Case 1—A man of 35 years well developed the small intestine had a distinct pink colour but no other macroscopic pathological condition was found

Case 2—A man of 59 years The small intestine showed an abnormal pink colour, the spleen was exceedingly soft and friable Nothing else abnormal was found

From both cases portions of small intestine liver kidney and spleen were sent for bacteriological examination to the Ministry of Health Bacteriological Laboratory The report on the material sent to this laboratory was as follows

BACTERIOLOGICAL EVIDENCE

	Material	*Bacteriological Findings*
1	Six stools	*B enteritidis* Gaertner in large numbers
2	One unopened tin of mutton from same consignment	Negative result
3	Two tins which had contained mutton	Negative result
4	Portion of liver spleen kidney and small intestine from Case 1	*B enteritidis* +
5	Portion of liver spleen kidney and small intestine from Case 2	*B enteritidis* + except in small intestine

After recovery agglutination tests were carried out at the institution on the remaining twenty nine suspected patients

Patients	*Positive Agglutination for B enteritidis*
Females (17)	12
Males (12)	9

Agglutination results varied from 1 in 25 to 1 in 500 + Thus we can say that twenty three patients almost certainly suffered from a *B enteritidis* infection Those who gave no positive agglutination were classified during the acute stages of their illness as mild cases and may have been cases which through extreme caution were included as probably suffering from food poisoning

Agglutination tests against *B enteritidis* were made on all the people who had handled the food as follows

Stores—two staff and three patients
Kitchen—seven staff and twelve patients
Bakehouse—one staff and three patients
Farm (milkers)—three staff and eight patients

The results of these tests showed

Stores—no positive reactions
Kitchen—eight positive reactions (six staff and two patients)
Bakehouse—one patient gave a positive result
Farm—two patients gave positive results

All these agglutination tests were carried out after ten days had elapsed from the beginning of the outbreak It is interesting to note that only one member of the kitchen staff gave a negative result and that particular maid was away the day that the mutton was used Most admitted eating small portions of the mutton None apparently were ill One faecal bacteriological examination was made from each of the above persons and all gave negative results

s imulation of smooth muscle plays a part in the processes of nutrition and mobilization of the spermatozoon, but no general conclusions can be drawn until further work has shown whether a chemical agent subserving such a function is present in other animals Methods of approach other than the rather direct ones used hitherto will probably be necessary More knowledge, for example, is needed on the comparative physiology of the accessory genital organs and the processes of ejaculation It may be that in some animals the nervous control of ejaculation predominates, so that the accessory effects of chemical substances such as prostaglandin are relatively unnecessary

A STUDY OF TETANUS

We have referred before[1] to the work of Abel and others, who have sought in a series of papers to demonstrate that tetanus toxin is blood-borne and not carried to the cord along nerves, as has been believed for many years Abel, Evans, and Hampil[2] have now published a further paper of great length in which this belief is reasserted, although a description of certain experiments bearing most directly on this specific question is again deferred to a later publication The study reported here was carried out mainly by the orthodox and laborious method of injecting toxin into a large animal, such as a sheep, and tracing its subsequent fate by bio-assay—that is, the injection of varying amounts of blood or organ suspensions into smaller animals This series of experiments is held to support several conclusions in which the nerve transport theory finds no place Briefly stated they come to this—that an exact minimum lethal dose of toxin is absorbed and fixed by susceptible tissues, any excess over this amount remaining in the blood and lymph This supposition would certainly account for the fact that in natural tetanus toxin is sometimes to be found in the blood and sometimes not The "irretrievable fixation" of a lethal dose of toxin by the tissues takes place within five hours of intravenous injection, and thereafter the fatal course of the disease is predetermined Toxin thus fixed is irrecoverable—that is, an organ containing its quota of a lethal dose is nevertheless harmless, after perfusion, to other animals This is a fundamental and very interesting observation, which, if correct, invalidates a great deal of previous work, for it simply means that the estimated toxin contents of organs have been a function of their vascularity, and the comparatively bloodless condition of the cord itself post mortem explains the negative results of many attempts to demonstrate the presence of toxin in it Suggestive as these observations are many will feel that this matter is still *sub judice* There are arguments in favour of the nerve transport theory which remain unanswered in Abel's work and everyone who has read these papers will hope that in the next he will withhold none of the experimental data on which his conclusions are based No one will now dispute that tetanus toxin can be blood borne especially when large amounts of the preformed toxin are injected experimentally but under the somewhat different conditions of the natural disease the hypothesis of neural spread still appears to fit some of the facts better than any other

EVIPAN FOR DELIRIUM TREMENS

Luckily it does not very often fall to the lot of the general practitioner to have to treat cases of violent delirium tremens, but when it does so happen he will turn with especial gratitude to any drug which offers hope of quieting the patient and terminating the attack Few cases can present greater difficulties than this—a hallucinated struggling, shouting patient, almost impossible to feed, requiring two or even more attendants, with perhaps a cardiovascular system threatening to break down, and often seemingly quite uncontrolled by even massive doses of the customary sedatives Dr P Sperber[1] now reports three cases that he has treated at an American penitentiary by the intravenous injection of sodium evipal (evipan) Like other physicians he has often found even large doses of morphine or paraldehyde to be useless in outspoken delirium, though a strong mixture of bromide and phenobarbital might prevent an attack developing In the cases described a solution of 1 gramme of sodium evipal in 10 c cm of sterile distilled water was made up (that is, 10 per cent) and 2 c cm was first injected slowly into the vein As might be expected, this is no easy matter in delirium tremens and in one case six attendants were required to hold the patient reasonably still Almost as soon as the injection (2 c cm) was given the patients relaxed, yawned, and dropped off into a deep sleep, after this 1 c cm more was injected All these patients slept, with only one short break, for from eighteen to twenty-four hours, after which they woke fully orientated and sensible, and with no recollection of the attack Such prolonged sleep is not unusual at the end of an attack of delirium tremens, apart from any specific drug effect, but these results are certainly striking in the remarkable cessation at once of so serious a condition It is of course unwise to judge the value of any form of treatment on the results in three cases only, but it would appear hopeful that in sodium evipal a drug of real value in delirium tremens may be available Its use in further cases is certainly justified, and results will be awaited with interest, though it is to be anticipated that with careful preventive measures and proper judgement in the sudden withdrawal of alcohol in addicts the incidence of delirium tremens will gradually be still further reduced

THE EGG MEMBRANE TECHNIQUE IN VIRUS WORK

When Woodruff and Goodpasture[1] demonstrated six years ago that filterable viruses could be grown on the chorio-allantoic membrane of the developing egg they gave to virus workers a new technique which bids fair to be of supreme importance in this line of research An increasing number of workers have made use of this method and it has been clearly shown not only

[1] *Amer J Path* 1931, 7 209

To reduce the displacement Silverman uses tenaculum forceps, which seize the malar bone through the substance of the cheek, but the amount of superficial swelling or the degree of displacement into the antrum would often preclude this method, whilst at any time such treatment of the cheek savours of the barbarous

Another method described by Mead (1933) is to screw a corkscrew into the malar bone through the cheek A better method than this would be to drill a hole into the malar bone through a small incision in the cheek and to tap a thread into which a tool could be screwed which would allow reduction either alone or combined with some form of extension apparatus

The various other methods do not merit mention except the most ingenious method of Gillies and Kilner (1927) in which an elevator is passed through a small incision above the hair line in the temporal region This is manœuvred down on the surface of the temporal muscle under the root of the zygomatic process, which is then levered outwards This method is often an excellent one, but it does not always succeed in retaining the bone in the corrected position Neither does it provide for drainage of the blood clot in the antrum If the antrum is not opened into the mouth at the operation such drainage is not absolutely necessary, for if left alone such a collection of blood clot rarely suppurates, but one of the most noticeable things about the method to be described is that those cases with moderate or severe pain nearly always get immediate relief as soon as the pressure caused by the clot is relieved by the establishment of drainage

The Author's Method

Dissatisfaction with the accepted methods of dealing with this fracture has led me to experiment with methods of reducing the displacement by working through an intranasal antrostomy opening Such a method has for some time now been standardized and is giving great satisfaction

The operation is performed by making a vertical incision in the nasal fossa from immediately above and in front of the anterior extremity of the inferior turbinate

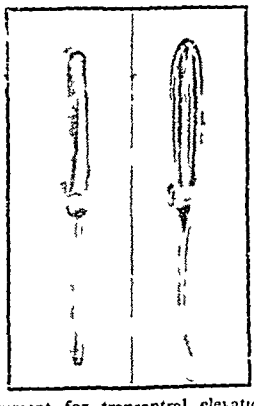

FIG 1—Instrument for transantral elevation of depressed malar bone

bone to well on to the floor of the nose The incision is carried as deep as the antro medial border of the maxilla which is then bitten away with strong Jansen Middleton forceps as in the Denker operation and the bony opening is carried backwards into the inferior meatus The clot in the antrum is displaced by packing the antrum with vaseline gauze and when it has been displaced the gauze is withdrawn An elevator which has been made for me by Elliott Brothers of Sydney (see Fig 1) is then inserted and the body of the malar bone is elevated into position (see Fig 2) In the event of such an elevator not being available the handle of a teaspoon with a narrow upper end can be used unless impaction is unusually firm The end of the spoon handle is inserted into the antrum so that its surface is horizontal

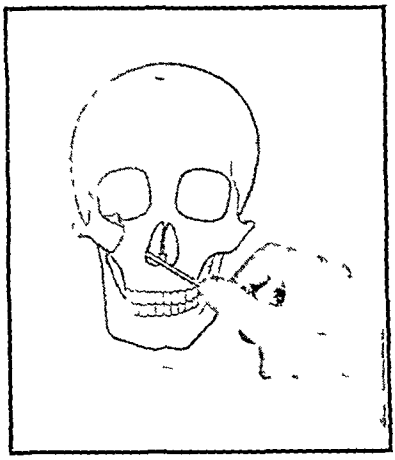

FIG 2—Showing how if the opening is made at the junction of the nasal and anterior walls of the antrum the depressed malar bone can be elevated with a comparatively straight instrument

with the patient in the anatomical position It is then turned so that the surface is vertical Previously I used a more posterior antrostomy opening but this necessitated a much more curved elevator In this older method the tip of the hook like elevator was used to perform the reduction, but with the later modification the use of a straighter elevator is possible and the reduction is performed with the side of it instead of the top as formerly

After treatment

Usually the displacement has no tendency to recur, and this is what one would expect as no important muscles are attached to the bony fragment, but where the edges of the opening into the maxilla are badly comminuted the malar bone is pressed back into the antrum by the weight of the cheek This is easily controlled by packing the antrum through the opening made with a long piece of 3/4 inch-wide vaseline gauze This is removed after two days and would be replaced if required, but so far this has not been called for Antral lavage is carried out a few times during convalescence

Advantages of the Method

This method provides an easy and certain means of reduction and retention of the fragment in position It also usually makes the patients quite comfortable as soon as the drainage is provided Even in the few cases where packing has to be left the patient is usually not more uncomfortable than before operation

The main objection to the method in the eyes of the general surgeon is that assistance must be sought from those used to intranasal manipulations but as the method is so much more satisfactory than any other described this should not exclude it

THE ADRENO-GENITAL SYNDROME AND TUMOURS OF THE SUPRARENALS

BY

A. W. SPENCE, M.D., M R C.P.

Tumours of the suprarenal glands of clinical importance may be conveniently classified as follows

CORTEX

Innocent Adenoma

Malignant Hypernephroma

Both may be associated with the adreno genital syndrome

MEDULLA

Innocent Phaeochromocytoma (hyperchromaffinism)—associated with paroxysmal or continuous hypertension

Malignant Neuroblastoma, causing clinical features of (*a*) Pepper type, (*b*) Hutchison type

The Adreno-genital Syndrome (Adrenal Virilism)

The adreno-genital syndrome is a reversion to masculinity, associated with carcinoma, adenoma, or simple hyperplasia of the suprarenal cortex, but these cortical changes are more often present without any somatic or sexual disturbances On the other hand, in some cases of the syndrome the glands may be apparently normal The clinical manifestations depend on the type of lesion and on the time of onset Malignant tumours are associated with more rapid changes than benign tumours of slow growth or simple hyperplasia The disease may arise at any age, even developing *in utero*, but when it supervenes during the period of rapid growth of the individual—for example, up to puberty—the changes will be more marked than when growth is not so rapid—for example, after maturity For this reason it is convenient to describe the condition as it occurs in different age groups, but it must be realized that there is no definite demarcation between each group and that each picture merges gradually into the other It is pre-eminently a disease of the female sex and afflicts males only during childhood It may be divided into four main clinical types those which arise—(1) during foetal life, (2) before puberty, (3) after puberty, and (4) after the menopause

DURING FOETAL LIFE

When the disorder arises before sexual differentiation the changes are those of feminine pseudo-hermaphroditism Externally the bodily configuration approaches the male type, with perineal hypospadias, a large clitoris penitormis, and a vulva-like cul-de-sac Internally a uterus and ovaries are present When it appears later in foetal life these changes are less pronounced a large clitoris and hypospadias are present there may be growth of hair on the face axillae and pubes, but the uterus and ovaries are atrophic

BEFORE PUBERTY

Manifesting itself during this period the condition is one of precocious puberty

In girls statural growth increases and the configuration of the body may approach the male type the voice may deepen and there may be a growth of hair of male distribution—that is, on the face, in the axillae, on the legs and forearms, and on the pubes extending towards the umbilicus They may become obese but the obesity is not that of childhood, but of the plethoric type seen in middle age As a rule the mentality is consistent with the true age of the patient, but occasionally there may be retardation of mental development or even severe mental disorder The external, but not the internal, sex organs develop precociously, especially the clitoris, which is hypertrophied Although the condition is termed "pubertas praecox" it is in effect a false precocity, as it is most uncommon for these patients to menstruate Ossification and dentition are often hastened, but as the epiphyses join earlier than usual their height is eventually less than normal Excessive muscular development, as in the male counterpart, is not generally found

In boys there are also increase in growth, deepening of the voice, and excessive growth of hair Ossification and dentition are hastened, with early union of the epiphyses The external genitals are greatly enlarged, resembling those of an adult, but usually there are no sexual changes such as libido In some cases, however, there may be increased sexual activity In one group there is a generalized obesity of the plethoric type, in another excessive muscular development and strength, described by Parkes Weber as the infant Hercules type, in others obesity and muscular development may be combined Finally the patient may become enfeebled through muscular wasting, develop a prematurely aged appearance, and die at an early age

AFTER PUBERTY

In adults the adreno-genital syndrome is practically confined to women, occurring most often between the ages of 18 and 25 One of the most troublesome symptoms in these patients is the hirsuties, which may be slight in some but very marked in others It is characteristically of the male type and may be widespread in its distribution It appears most commonly on the face as a beard and moustache, and on the forearms, thighs, and legs, the hair in the pubic region spreads upwards in a triangular fashion to the umbilicus, and may even cover a large part of the abdomen It may appear on the chest between the breasts, around the nipples, and on the back In older women the hair of the scalp may fall out, particularly in the frontal region

In some patients the voice deepens, the breasts atrophy, and the body tends to become masculine in appearance, but not to the same extent as in children in whom feminine characteristics have not fully established themselves before the onset of the disorder Other sufferers may become rapidly and excessively obese, with supraclavicular pads of fat, large pendulous breasts consisting mainly of fatty tissue, and folds of fat on the abdomen and back In these patients there may be purplish cutaneous striae situated over the lower abdomen At first menstruation becomes scanty and irregular, and later there is amenorrhoea, which is often accompanied by pains in the pelvis, nausea, and vomiting As in the other age groups the clitoris is often enlarged

Psychological changes may be a marked feature, although these are unusual Langdon-Brown and Girling Ball have reported a case of a woman whose earliest symptom was an obsessional neurosis that she was

TEXTBOOKS OF MEDICINE

The Practice of Medicine By Jonathan Campbell Meakins M D, LL D (Pp 1343 505 figures (35 in colour) 42s net.) London H Kimpton 1936
Textbook of Medicine By Various Authors Edited by J J Conybeare *M C* M D, F R C P Third edition (Pp 1027 illustrated 21s) Edinburgh E and S Livingstone 1936

It is a noteworthy event when a full blown textbook of medicine is produced from one of the Dominions The late Sir William Osler was Canadian born, and his influence on the development of transatlantic medicine as indeed on British medicine in general, has been enormous His textbook of medicine, however, was written during his tenure of the professorship of Baltimore In the new *Practice of Medicine* by Professor Jonathan Campbell Meakins we have therefore the first full textbook of medicine from Britain over-seas In its breadth of view and completeness it reminds us of that other splendid production from McGill University, the late Professor Adami's *Pathology*

In his disarming preface Professor Meakins explains that his object has not been so much to write for the specialist or produce an encyclopaedia as to interest and instruct the student and general practitioner Recognizing that in practice, whether in hospital or in private work, so far as the patient is concerned, disease consists of symptoms, he has given particular prominence to symptoms in his book On this basis their causation has been described where this is possible and their significance pointed out On analysing a series of a thousand cases it was found that the commonest symptoms tended to recur very often and were referable to no one particular system so that they could not be used for classification these were *pain weakness loss of weight, fatigue, shortness of* breath and fever There remain a number of symptoms which point to an affection of one or other system and these when followed up may give valuable clues to diagnosis and indications for treatment This has led the author to a new and individual method of presentation Following up symptoms he has grouped the diseases under the systems primarily affected It is unusual in a textbook to have cerebro spinal meningitis discussed in the section on the central nervous system typhoid fever and cholera among intestinal diseases rheumatic fever in affections of the nasopharynx but one can see that this is a logical outcome of the method adopted

The description of the various system diseases is concise and practical The student led to a particular system by the patient's leading symptom will find set out the various diseases which have to be thought of their differential diagnosis is explained and the corresponding treatment is advised The sections are up to date and Professor Meakins has had the advantage of experts in certain subjects among his colleagues as collaborators There remain then after the systematic sections certain infectious diseases conveyed by parenteral inoculation *diseases due to* allergy diseases due to abnormal environments variations of heat and cold of barometric pressure sea sickness exposure to radium x rays or electric shock and a group of diseases caused by chemicals and drugs These chapters are as useful and informative as those dealing with system diseases The author points out the modern dangers of excess in the prescription of barbiturate drugs enumerates those from which death has been reported, and gives helpful points in diagnosis and treatment

Professor Meakins observes that this is a pictorial age and that many factual data are well set out by graphic methods Many students can learn and remember from a simple, even crude, diagram facts that no amount of reading or hearing can impress The author has therefore introduced many illustrations—of patients, of pathological specimens, graphs, and radiographs—with the hope that they may be more informative than a word description, and the result on the whole has been highly successful The reproductions of *x* ray photographs leave much to be desired in definition, however, and this detracts from their value

The textbook is remarkably complete It is pleasant to handle, and we have no hesitation in recommending it as a reliable and up to date guide to medical practice

Conybeare's Textbook of Medicine compresses into a thousand pages the essentials of the subject and the new edition maintains the high standard set by the two former ones Dr Conybeare has been assisted by a team of experts each responsible for revising and in some instances *rewriting parts of the book* The *section on endocrines* has been extended and new work on the pituitary gland and its control of other endocrine glands is incorporated The authors still differentiate toxic adenoma from other forms of exophthalmic goitre A more fitting description is that they are agglomerations of active glandular tissue rather than true adenomata and the statement that these forms are sometimes described as secondary and primary Graves's disease is not sufficiently expanded The section on renal disease has been rewritten by Dr Osman and now gives a very fair account of modern views on kidney function and dysfunction Under the heading of Bright's disease the classification adopted is in three main groups —nephritis nephrosis and nephrosclerosis—each of these groups being subdivided The section closes with discussions of affections of the urinary tract new growths of the kidney, and renal calculus Dr Conybeare has brought up to date the section on the alimentary canal many of the articles being rewritten, and has revised the one dealing with affections of the bones and joints adopting the classification suggested by the British Committee on Chronic Rheumatic Diseases The book should continue to be useful to students and practitioners

THE COLLOIDAL STATE

Kolloidik Eine Einfuhrung in die Probleme der Modernen Kolloidwissenschaft By Priv Doz Dr A von Buzagh (Pp 323 68 figures RM 15 geb RM 16 50) Dresden and Leipzig T Steinkopff 1936

This Introduction to Modern Colloidal Science by Dr von Buzagh of Budapest is a textbook of some 300 pages in which the author sets forth in a systematic manner our present knowledge of the chemistry and physics of the colloidal state The chemistry of colloids is a field in which the biochemists have taken a particularly keen interest because living matter is composed of colloidal material hence the first developments of this comparatively young science were largely associated with biochemistry This stage of rather one sided development has now passed and the work under review deals with the properties of matter in the colloidal state from the point of view of general physical chemistry As the author remarks Colloidal chemistry has left its childhood behind and has reached the stage of objective criticism

In general the textbook gives a very clear account of the physico chemical laws governing the behaviour of matter in the colloidal state One inevitable result of

observed on x-ray examination Paroxysmal hypertension may eventually become persistent, and hypertensive crises may supervene in continuous hypertension

Neuroblastoma (*Sympathoblastoma*)—These tumours appear very early in life and arise from the sympathetic ganglion cells They are highly malignant and were formerly regarded as sarcomata They are divided into two main types, but the histology is essentially the same in each The type described by Pepper occurs in the youngest infants, and is characterized by metastases in the liver, lungs, and abdominal glands In these cases the primary growth is more often situated in the right suprarenal, which may be palpable In the Hutchison type the primary tumour is more usually in the left suprarenal and metastases appear in the cranium and behind the orbit, causing proptosis and papilloedema, and simulating the clinical picture of chloroma and of intra-orbital haemorrhage in scurvy

A David Anderson Berry gold medal, together with a sum of money amounting to about £100 will be awarded in July 1938 by the Royal Society of Edinburgh to the person who in the opinion of the council has recently produced the best work on the nature of x rays in their therapeutical effect on human diseases A similar award will be made every three years Applications for this prize are invited They may be based on both published and unpublished work should be accompanied by copies of relevant papers and must reach the general secretary Royal Society of Edinburgh, 22, George Street, Edinburgh 2 by June 1 1938

WOMEN'S WELFARE AND BIRTH CONTROL

DEPUTATION TO MINISTER OF HEALTH

Sir Kingsley Wood, the Minister of Health, received on February 2 a deputation organized by the National Birth Control Association, representing twelve societies interested in the subject of women's welfare and birth control The deputation was introduced by Lord Horder, and the other principal speakers were the Countess of Limerick, Dr Jocelyn Moore Mr Cedric Lane Roberts, Lady Denman, and Mrs Freeth

The deputation urged that the present provision of gynaecological clinics to deal with the medical care of married women at which advice on contraception would be available to those women for whom further pregnancy would be detrimental to health, was inadequate and that but little exercise had been made by local authorities of the powers which they possessed in the matter Increased provision was very necessary, and it would lead to a reduction not only in maternal morbidity and mortality, but in criminal abortion which was due to the need felt by women to escape pregnancy on medical and other grounds

The Case for More Clinics

The deputation urged the Minister to issue a circular to local authorities encouraging them to establish gynaecological clinics in which birth control should take its proper place as part of the general medical care of women, and indicating the lines on which the clinics should be run The deputation attached great importance to the work being carried out as an integral part of the maternity and child welfare schemes of local authorities

The Minister's Reply

Sir Kingsley Wood said he recognized the force of many of the arguments that had been advanced by the deputation, but that both Minister and local authorities were bound to observe the limitations imposed by Parliament on their activities The local authorities, for instance had at present no legal power to provide birth control clinics as such, and there was no statutory duty upon them to provide advice or medical assistance in relation to birth control There were still differences of opinion, and in a matter of this kind particularly it was necessary and right that the legislative position should be fully maintained, and if any alteration in policy was made it should receive Parliamentary approval

The Maternity and Child Welfare Act empowered local authorities to make arrangements for attending to the health of expectant mothers and nursing children under school age A clinic provided under the Act could not, therefore lawfully be used for any woman who was not an expectant or nursing mother Such clinics were not primarily intended for sick women In fact the object of the Act was preventive, and expectant and nursing mothers were encouraged to attend these clinics in order that sickness should, if possible, be avoided

Existing Clinics

There were also the clinics provided under the Public Health Acts and their functions were different from those of the maternity and child welfare clinic They extended only to the provision of hospitals or clinics for the reception of sick persons but any sick woman might attend such hospital or clinic for advice and treatment Apart from the clinics for ante-natal or post-natal supervision of expectant or nursing mothers and clinics for the treatment of women who were sick, there was no statutory authority for the establishment of clinics providing for the facilities suggested by the deputation

Sir Kingsley Wood emphasized that the maternity and child welfare centres were not ordinarily designed or

SURGICAL PROGRESS

The 1936 Year Book of General Surgery Edited by Evarts A Graham A B M D (Pp 871 illustrated 7 dollars or 12s 6d postage 6d) Chicago The Year Book Publishers London H K Lewis and Co 1936

This book edited by Professor Evarts Graham of St Louis is a guide to some of the chief developments in surgery during the year It is one of a series of ten which the American publishers tell us form the Practical Medicine Year Books and are now in their thirty sixth year The whole ten volumes comprise a survey of progress in the various branches of medicine and may be compared with the *Medical Annual* which is so much appreciated and extensively used in this country

The title General Surgery is a wide one as sections are included on the brain and meninges, the spine and cord and on orthopaedics and chest surgery, but abdominal surgery is well represented Of the eight hundred odd pages of text nearly two hundred are taken up by references to the liver gall bladder, and bile ducts Should this seem a little disproportionate we must remember that it was the distinguished editor of the Year Book who introduced cholecystography into surgery—and who is to question him if he regards as of chief importance the particular branch of surgery in which he is particularly interested?. The editorial comments which are in small bracketed print of close type interspersed through the various sections, are an attractive feature, as is also the cross referencing to previous editions of the year book The review for 1936 has brought out a number of valuable comprehensive studies such as the question of the treatment of bleeding peptic ulcers the after-effects of gastro duodenal ulcer and the treatment of fractures and important contributions to these questions are reviewed in the text The volume is well illustrated of convenient size and of very readable print There is no reference to surgery of the sympathetic nervous system perhaps this indicates a swing of the pendulum!

This continues to be an attractive yearly publication which should be a useful addition to the bookshelves of both the surgeon and the general practitioner since it enables either to refer to recent developments in surgery with a minimum of effort

Notes on Books

Dr BERNARD SACHS'S *Keeping Your Child Normal* (New York Paul B Hoeber 1 50 dollars) was first published ten years ago under the title of *The Normal Child* The author stresses the fact that while much care and thought have been lavished on defectives the problem of the normal child has been somewhat neglected He cites the justifiable lament But I am a perfectly normal child so I don't get any attention The present volume which has been revised and brought up to date is intended as a guide for parents teachers and physicians with a view to remedying this deficiency Dr Sachs combines a scientific outlook fortified by wide experience of child neurology with wisdom and common sense and the book contains much helpful advice for the surprisingly large number of people who need assistance in the problem of bringing up children with efficiency and sympathy

The fourth volume of the forty sixth series of *International Clinics* (J B Lippincott Co set of 4 volumes 50s) contains nineteen papers of which seventeen are devoted to internal medicine and two to dermatology Among the former special attention may be drawn to those on gastroscopy by Dr Jacob Schloss of Boston changes in blood protein during acute rheumatic carditis by Dr Alwin F Coburn of New York essential thrombocytopenic purpura by Dr Herbert Z Griffin of the Mayo Clinic, nutritional oedema by Dr John B Youmans of the Vanderbilt University School of Medicine, Nashville the medical aspect and treatment of chronic gall bladder disease, by Dr George Morris Piersol of Philadelphia and the relation of accidents and injury to pulmonary tuberculosis, by Dr John B Hawes of Boston The section on dermatology contains two papers by Dr Isaac R Pels of the Johns Hopkins School of Medicine on acne and scabies respectively

The work on *Infektionskrankheiten*, by Professor WERNER SCHULTZ which forms part of the series for post graduate instruction edited by Professors L R Grote A Fromme and K Warnekros (Dresden and Leipzig Steinkopff R M 12) gives a clear, concise, and up to date account of the common infectious diseases prevalent in temperate climates as well as of malaria and the treatment of tropical diseases which are described by Dr A Haver Professor Schultz who is well known in this country as being the first to describe agranulocytosis in 1922, is peculiarly fitted for his task having had many years practical experience of infectious diseases as well as having been a lecturer on the subject at the Berlin Academy and University While special attention is paid to treatment the pathology and bacteriology are adequately dealt with A bibliography of almost exclusively recent German literature is appended

Preparations and Appliances

SALICYLYSIN PREPARATIONS

Salicylysin liniment and ointment (Allen and Hanburys Ltd) contain 20 per cent of glycol iodosalicylic ester This is a new compound which contains iodine and salicylic acid, but does not stain the skin and is practically odourless The preparations are recommended for local treatment of arthritis fibrositis sprains etc

TABLOID SULPHONAMIDE-P

Tabloid brand sulphonamide P (0 5 gramme) issued by Burroughs Wellcome and Co is intended for oral administration in the treatment of infections with haemolytic streptococci Observations in animals and in man agree in showing that it is possible by administration of this drug to render the blood bactericidal to those organisms This important discovery is so recent that the clinical evidence, although favourable is at present limited The makers issue with their product a leaflet containing instructions for use and certain important suggestions In particular they point out the need for determining whether the infection it is proposed to treat is due to haemolytic streptococci

SULPHONAMIDE P (B D H)

Sulphonamide P (B D H) is a tablet preparation (British Drug Houses Ltd) of the new disinfectant para amino benzene sulphonamide This drug has been proved to render the blood antiseptic to haemolytic streptococci A remarkable feature of this action is that it can be produced by oral administration This discovery has naturally aroused great interest and the preliminary clinical reports are favourable The drug is being tried in the treatment of puerperal septicaemia erysipelas scarlet fever tonsillitis and other infections of haemolytic streptococci

AMMONIUM MANDELATE SYRUP

Syrup of ammonium mandelate (C J Hewlett and Son Ltd) contains 3 grammes of mandelic acid in 2 fluid drachms This preparation is a substitute for the more complex method of giving sodium mandelate and ammonium chloride separately to produce urinary disinfection Usually the ammonium mandelate alone is sufficient to produce an adequate urinary acidity but if this does not occur ammonium chloride may be given in addition The preparation provides a convenient and palatable method for mandelic acid therapy

USE OF HEARING AIDS

THE BEST TYPE OF APPLIANCE

The latest contribution to the study of the use of hearing aids is a *report*[1] issued by the Medical Research Council on the recommendation of its Hearing Committee The authors are Dr A W G Ewing, Mrs I R Ewing, and Dr T S Littler of Manchester University, and the report gives the results of their investigations into the utility of hearing aids for deaf people, and into methods for determining what types of instrument are best suited to particular cases

The investigation embraces three main problems

1 How does the ear of a partially or severely deaf patient behave when stimulated by loud sounds, and to what extent can speech be made intelligible to him by amplification?

2 What are the characteristics of the most efficient type or types of aid?

3 What tests will ensure that the patient may be effectively advised as to what, if any, type of aid is suitable to his individual needs?

The first of these is an all-absorbing problem Teachers of the deaf, otologists, and others have never been able to give a satisfactory answer to the question, 'What actually do the deaf hear?" Indeed, there is no proof, even with normally hearing persons, that a sound stimulation such as the ringing of a bell produces identical effects in any two individuals However this may be, it is still possible by suitable amplification to make speech intelligible to most deaf people

The authors state "In so far as the deafness is of a permanent character, no hearing aid can in any literal sense restore to him the capacity to respond to sound over the lost frequency-intensity range" This appears to suggest that no hearing aid is capable of producing an actual improvement in a deaf subject's hearing Certain workers in this field, however, claim that by regular stimulation for a period of about two hours daily for some months an improvement in hearing is obtained in many deaf people, and substantiate their claim by the difference shown in the audiometric curve before and after stimulation In order to carry out the tests in this investigation a beat-tone oscillator of National Physical Laboratory type was used for the pure-tone tests For measuring audibility and intelligibility of amplified speech a Western Electric moving-coil microphone and associated amplifier was used to obtain speech levels which could be controlled A meter was placed at the output of the apparatus to indicate the output level and thus enable the speaker to maintain a fairly constant speech level With this apparatus it was possible to control the speech intensity received by the subject, and also to determine his speech threshold

The Threshold of Audibility

A method of measuring the effective amplification of hearing aids under working conditions was evolved A clinical examination and report was made in each of the nine subjects who took part in a prolonged series of experiments Much patient work has been done in these experiments not only by the authors but also by their subjects and many interesting and valuable results have been obtained It was found that the threshold of audibility for speech could be deduced from the thresholds for pure tones and that in general it is within 5 or 10 decibels of the patient's lowest reading for pure tones over the frequency range 250 to 4000 cycles The authors regard the pure tone tests as a reliable index of the intelligibility of speech to the deaf listener This would probably be challenged by workers who argue that speech is a complicated mixture of sounds unlike simple tones, and that there is masking by one or more components of other components They say that when masking effect is taken into account there is a considerable difference between the pure-tone curve and the curve embracing the masking effect The authors found that stimulation by pure tones at large intensities caused variation in the threshold of minimum audibility Instances occurred in normal subjects in which fatigue equivalent to a considerable degree of deafness and sufficient to alter the quality of the human voice, persisted for several minutes, and in some cases hours

After listening to sound continuously maintained for two minutes at 110 db above the threshold of minimum audibility, normal subjects invariably showed a temporary diminution of auditory acuity over some part of the range of frequency involved in speech The minimum intensities at which maintained pure tones excited auditory fatigue were found in general to be considerably less than those of the threshold of feeling The magnitude of the fatigue was shown to be related to the duration of the stimulus Possibly if the stimulation were sufficiently prolonged it would definitely injure the auditory organ Whereas these effects were observed with pure-tone stimulation, loud speech of similar intensities produced no temporary loss in acuity whatever The probable explanation of this, as the authors point out, lies primarily in the brief duration of the loudest components in speech sounds, which at most last half a second Deaf subjects, on the other hand, were found not to be so susceptible to fatigue by pure tone stimulation, the threshold for feeling is the same for both The optimum intensity level of speech for normal listeners has been demonstrated by Bell Telephone Laboratories to be 70 db In the case of the deaf the authors found it to be round about 110 db or a little lower

The authors, discussing different types of hearing aids, conclude that the best results are obtained with valve amplification instruments, and draw attention to the very marked limitations of the commercial bone conduction aid—a timely warning in view of the sweeping claims made in the daily press for this type of instrument They comment on the restricted usefulness of the non-valve battery aids of popular type, handicapped as they are by their low amplification, background noise, and undesirable character of their frequency response There is, as they point out, even negative amplification at some frequencies in certain of the smaller aids They have also investigated the intelligibility of speech tests, using telephones with different frequency responses

Deaf Children

Particulars are given of 236 pupils in a school for the deaf They are divided into three groups

I	Totally deaf, no response to audiometer	43
II	Responded to only one or two frequencies of audiometer	44
III	Could respond to three frequencies or more	149

It was found that children belonging to Group II, although not totally deaf, could derive no appreciable benefit from the use of any aid Groups I and II together comprise more than one-third of the total This figure is very much higher than the comparable groups among the deaf children of London Emphasis is laid on the importance of supplementing the use of hearing aids by lip reading A short account is given of the results of the use of hearing aids for class teaching, and the authors comment on the great advantage of this method over previous ones They point out that reproduction of the highest quality is most important to the severely deaf child who is dumb or very retarded in speech when he comes to school Attention is also drawn to the fact that a class amplifier yields better results than smaller individual aids employed by children at a distance from the teacher

Conditions of Supply to the Public

From their experience the conditions under which hearing aids should be supplied to the public include

(*a*) Tests of the patient's response to pure tones of the speech range

[1] *The Use of Hearing Aids* By A W G Ewing, I R Ewing, and T S Littler Med Res Counc Spec Rep No 219 H M Stationery Office (9d)

mended that such research should be undertaken It stressed also the desirability of a far closer relation than has existed in the past between physical education and the science and art of medicine and as a means to this end, it suggested the establishment of post graduate courses designed to equip medical men and women for the medical supervision of physical activities Perhaps in time such courses may be instituted at the National College However this may be, the present proposals of the Government should go far to bring about the desired improvement of the national physique and they must be regarded as deserving high praise

CANCER PROBLEMS

On February 3 Dr W Cramer of the Imperial Cancer Research Fund read to the Assurance Medical Society under the title "Cancer and the Expectation of Life," a very lucid and instructive paper The title does the paper some injustice, it was presumably suggested by the belief that officers of insurance companies have a special partiality for the arithmetical average called the expectation of life—that is, the average number of years lived by persons who reach any year of age in and from that year of age This average has increased at all ages of males below 62 and at all ages of females below 74 between the dates of the last two national life tables Dr Cramer really discusses much more interesting topics Is there reason to believe that a heritable predisposition to develop cancer occurs? Is there reason to believe that environmental factors other than a small number of notorious stimuli, favour or oppose the development of cancer?

With regard to the first question, the existence of an inherited disposition in mice is proven Dr Cramer thinks that the statistical data of Deelman (1930), Waaler (1931), and Wassink (1935) are sufficient to demonstrate the existence of a heritable factor in man One of the reasons why this was not shown earlier is the apparent specificity of the factor It seems, for instance, that when the blood relatives of cancer patients are traced the female relatives of women with cancer of the breast or cancer of the uterus have a higher incidence of cancer of the breast or uterus than other women They do not suffer from cancer of other sites nor do their male relations, at rates higher than those of the general population So far as proportional incidence is concerned the evidence is strong To assess the absolute worsening in the prognosis for a person some of whose ascendants had cancer in comparison with that for a person without this history is an impossible task Dr Cramer calls attention to the exceptional position of cancer of the breast in this country, the rate for which is high and shows an increasing incidence even in the earlier age groups "One cannot avoid, therefore," he writes, "the uncomfortable suspicion that this may be due to an increase in the number of individuals with an inherited susceptibility to breast cancer Fortunately we can set against this a decrease in the mortality from uterine cancer" We do not find this wholly convincing It appears that in respect of both organs there is a heritable predisposition Assuming that the general lowering of mortality at early ages has led to the survival to cancer age of a larger proportion of the "unfit," there should have been an increase in the numbers of susceptibles of both types The difference between the rates for the two organs seems to be associated with changes in the birth rate It is known that the rate of mortality from cancer of the breast is, other things equal higher in virgins and that for cancer of the cervix uteri lower than among women who have borne children Unfortunately large scale data must depend upon the broad classification by civil state We cannot study the evolution in time of the mortality rates for women who have been pregnant 0, 1, 2, etc, times on unbiased collections of data

The second part of Dr Cramer's paper is based upon the late Dr T H C Stevenson's analysis of the national data which tended to show that the incidence of fatal cancer of "exposed" sites increased as one passed down the economic scale Dr Cramer very properly regrets that other nations have done so little in this important field Since it became generally recognized that the statistical treatment of massed data could not be expected to solve the fundamental problems of aetiology there has been a tendency in scientific circles to depreciate the value of statistical study in cancer research Actually there is room for ancillary investigation This subject of social cancer, as it has been called, is one of the fields to be explored Dr Stevenson's work here was of first-rate importance and should encourage others

Since cancer as a cause of death mainly affects persons at a time of life which allows or enforces leisure for reflection and even literary composition it is natural that discussion of the subject should be extensive A special merit of Dr Cramer's paper is that it puts the subject into correct perspective Not only does it hold out hope of further advance by means of investigations within the competence of many people, but it certainly does not suggest that the (relatively) aged of to-day are much worse off than their grandparents

THE QUESTION OF MEDICAL PATENTS

A GENERAL SURVEY

From time to time the British Medical Association receives requests from members for information and advice on the subject of medical patents and on the propriety of medical practitioners receiving financial reward for discoveries and inventions in the medical field. This is a matter which a few years ago occupied the prolonged attention of the Association and several other organizations, and it may be of interest to members to have a restatement of the position of medical practitioners in relation to the Patents Acts and a survey of the action which has been taken by the Association on the subject.

Attitude of the Profession

The patent system in this country is governed by the Statute of Monopolies 1624 by the Patents and Designs Acts passed at various dates between 1907 and 1932, by Rules made under the Acts by the Board of Trade, and by judicial decisions. Its aim is to encourage industry and commerce by means of temporary monopolies granted to persons responsible for inventions upon which extensions or improvements in industry are based. The subject of this temporary monopoly, or patent, must be a "manufacture"—that is to say a process or product of manufacturing. Chemical and medical inventions are not excluded, but patents in respect of substances intended for food or medicine are subject to the issue of licences limiting the use of the invention to the preparation of food or medicine on terms which will make the product available at the lowest price consistent with due reward to the inventor. There are many arguments for and against the general principle of patenting, but on the whole the system has in the past worked satisfactorily in this country from the point of view of industry and commerce. The medical profession, however, has made little use of the facilities for patenting. The professional view was expressed in the following resolutions passed by the Central Ethical Committee in 1903 and 1920 respectively:

> 1. That it is undesirable for a medical man who has invented a device intended for medical purposes to take out a patent for the purpose of deriving from such patent the financial results of a monopoly.
>
> 2. That it is contrary to the ethics of the medical profession to attempt to secure a monopoly in the sale of any article used in the treatment of disease and especially by patenting any such article in the name of a medical practitioner whose name would necessarily be used in its advertisement.

The fundamental objections of the medical profession to patents are based on its opposition to any procedure involving secrecy or monopoly since such a procedure limits the application of an invention and therefore benefits the individual inventor at the expense of mankind in general. Medical research in this country is founded on free intercourse between workers and any new discovery or invention is at once made known to the profession as a whole. Moreover a medical invention is seldom the work of one person. The final results which could be patentable depend to a very great extent upon previous contributions made by a number of individual workers, and it is therefore unfair that the worker who happens to add the finishing touch to a series of these series should deprive his fellow workers of their reward by patenting the invention.

Until the last decade these objections have been regarded as axiomatic throughout the profession in this country, and they have been recognized as the professional attitude by manufacturers of medical substances and appliances. The rapid progress of medical and biological research during recent years, however, and the free use of British patents by foreign workers and commercial organizations, often to the detriment of British medicine, have led a section of the profession and chemical manufacturers to desire a revision, or at least a reconsideration, of the professional attitude towards medical patents. It is pointed out that the foreign patentee, whose invention is often merely the addition of the final stage to the prolonged research of the British worker, robs the latter of the reward of his labour and even of the right to use his results. A further impediment is placed in the way of British research by those patents for processes such as the production of hormones, vitamins and sera, which are based rather on the expectation of results of financial value than on satisfactory investigations already concluded. Such patents are carefully drawn to cover a wide range of possibilities, and they consequently discourage further research in the same field.

Delegation of Patent Rights

A few attempts have been made by research workers to protect their results by patent law and at the same time to deny themselves any private financial gain. The Drs. Dick patented their scarlet fever toxin and antitoxin but delegated their patent rights to a scarlet fever committee. The patent for Sir Frederick Banting's process for the preparation of insulin was taken out in the name of the University of Toronto and the British patent rights were vested in the Medical Research Council which used them to prevent the exploitation of insulin and to ensure the maintenance of a high quality until the Therapeutic Substances Act of 1925 rendered them unnecessary. But even the delegation of patent rights to universities does not always effectually prevent exploitation. A British patent for Steenbock's process of imparting antirachitic properties to foodstuffs by artificial ultra violet irradiation was taken out in the name of the University of Wisconsin. This patent was granted at a stage when knowledge of the subject-matter was very imperfect, but it was drawn in such wide terms that it covered work of much greater importance performed by other persons who, both before and after the granting of the patent were working towards the same end. The patentee is consequently able to claim control over all application of knowledge of this particular subject even though that knowledge be of independent origin. The Wisconsin patent also illustrated another possible danger in the delegation of patent rights to universities. While the research worker himself forgoes any personal profit the particular university concerned may be tempted to use the rights for the promotion of its own interests or for purposes not connected with the invention patented.

Departmental Committee

This was the state of affairs when in 1929 the President of the Board of Trade appointed a committee to consider the Patents and Designs Acts and the practice of the Patent Office. Certain prominent research workers, the British Dental Association, and the Association of British Chemical Manufacturers approached the British Medical Association with the request that it would review the position of the medical profession in relation to the patent law, and avail itself of the opportunity of presenting the professional point of view to the Departmental Committee. A special subcommittee was set up to consider the ethics

GONOCOCCUS ANTITOXIN

We publish in this issue a very favourable report by Dr T Anwyl Davies on the treatment of gonorrhoea with an antitoxic serum The starting point of the work which has led to the adoption of this treatment was an attempt by Corbus[1] to prepare a Bezredka 'antivirus' for active immunization in gonorrhoea His difficulties with culture media led him to consult *Dr N S Ferry who supplied him with the culture* filtrate which constitutes an "antivirus" in Bezredka's sense and this material appears to have been extensively used for treatment although not with uniformly good results a recent report by Denkin distinctly condemns it Meanwhile Clark Ferry and Steele,[2] who had prepared this material were investigating its properties on their own account and came to the conclusion that it was not "antivirus" but that it contained an exotoxin The validity of this conclusion is of vital importance not only because it is the whole theoretical basis of the present serum treatment but because these methods of investigation were then applied to a closely related organism—the meningococcus In a subsequent series of papers[4] these authors claim also to have demonstrated the existence of a meningococcus exotoxin the new serum treatment for *cerebro spinal fever to which these investigations have* led is already more familiar than the corresponding treatment for gonorrhoea In each case the chief item of evidence for the existence of an exotoxin in culture filtrates is that dilutions of these filtrates will produce skin reactions analogous to the Schick and Dick reactions which are prevented by immune serum The principal objection to accepting the exotoxin hypothesis is that *gonococci and meningococci are notoriously* subject to rapid autolysis and during the four days or more of growth which precedes filtration so much intracellular material must be liberated by actual lysis that the secretion of toxin by living cocci is simply incapable of proof Although in a sense this question is mainly of academic interest, it is deeply involved when we come to consider appropriate methods of titrating an antiserum Everyone interested in this matter is agreed that *it is in a highly unsatisfactory* position Should living meningococci be used in protection tests or suspensions of dead cocci or culture filtrates and by what route should they be administered in what animal? It may be observed here that Miller and Castles[5] have added another to possible methods of this kind by their observation that meningococci will multiply freely in the peritoneal cavity of mice if mucin is added to the inoculum and thus produce something more resembling a natural infection

These considerations may appear rather remote from the subject of Dr Anwyl-Davies's paper but they have in fact an important bearing on it His opinion of the clinical value of gonococcus antitoxin is decided and will command respect The wider adoption of this treatment or of the treatment of cerebro spinal fever with the same type of serum must lead to the production of these sera in other laboratories than those from which the present supplies have emanated and will demand as indeed all recognized forms of serum treatment demand that there shall be accepted standards of therapeutic activity and accepted methods of verifying them These standards and methods do not exist The effect of Dr Anwyl Davies's report may well be to stimulate a wider interest in this subject and to induce others to study the mechanism of the *results he has observed this is certainly a matter* calling for the services of a larger field of investigators than have so far been engaged in it

PROSTAGLANDIN AND VESIGLANDIN

The demonstration of the presence in various tissues of substances other than hormones with active pharmacological properties is now familiar The most recent addition to the list of active agents of this sort is that described in 1933 by M W Goldblatt[1] and about the same time by v Euler[3] The former detected it in human seminal plasma and the latter has lately demonstrated its presence in the secretion and extracts from the prostate and seminal vesicles of man It was possible to show that the substance, called "prostaglandin" by v Euler is distinct from all other known active principles extracted from tissues V Euler at first thought it was identical with the P substance extracted by himself and Gaddum from horse intestinal *muscle and brain tissue but more recently he agrees* that it is a hitherto undescribed substance The outstanding properties of this new agent are powerful depressor vasodilator stimulant to the smooth muscle *of the intestine and uterus Goldblatt showed that it* causes rhythmical contractions of the isolated seminal vesicle The substance appears to be acid in character and is soluble in water alcohol acetone and in certain conditions in ether and chloroform it is very stable at *p*H 1 to *p*H 7 but is readily destroyed by alkali and also by free halogen It produces a large and prolonged fall of blood pressure which is unaffected by paralysis of the parasympathetic nerves Its action on smooth muscle is unaffected by atropine, so that it must be regarded as acting directly on the muscle A similar substance was also demonstrated by v Euler in extracts of the seminal vesicles and semen of monkeys *he names it vesiglandin" and shows that* in quite definite respects it differs from prostaglandin—for example it is less stable in acids and alkalis and has relatively a very slight action on smooth muscle These pharmacologically active bodies exert their effects in very small quantities and appear to be specific to the genital accessory glands and the seminal fluid Both the above investigators failed to find the substance in other animals except the sheep (v Euler) The possible function of such a body in the mechanism of ejaculation suggests itself but its absence from the seminal fluid and glands of animals other than man and the sheep makes the problem difficult It is reasonable to suppose that local vasodilatation and

Patents and Designs Act of 1932 follows in the main the recommendations of the Departmental Committee, and makes no substantial change in the law so far as medical patents are concerned

During the course of its work on patents the Association endeavoured to make use of its representation on the Association Professionnelle Internationale des Médecins to test the feeling of the profession abroad on the subject It was known that in certain countries, including Germany, France and Switzerland, medical substances were not capable of protection by patent law, but a questionary was prepared by the B M A, for issue as one of the A P I M s regular inquiries, with the object of ascertaining the views of the various national medical associations The number of replies received was smaller than in any previous inquiry, and from the discussion at the annual meeting it was evident that the question had never received thorough consideration in other countries The associations were therefore requested to give the matter their attention, and after an interval of one year a short questionary was circulated asking for their opinions on the propriety of medical practitioners taking out patents for inventions and on the desirability of a system of dedicated patents Again the replies were not very helpful to the B M A, although more were submitted it was clear that no great interest was taken in the subject Six out of thirteen national medical associations considered that a medical practitioner should be permitted to patent his inventions, and only two countries—Great Britain and Luxemburg—expressed themselves in favour of dedicated patents The discussion at the following annual meeting showed that it would be impossible to find a common ground for agreement, and that the profession in this country must continue to frame its policy on the assumption that the abolition of medical patents by international agreement is impracticable

PROBLEMS IN PRACTICE

(These columns are devoted to matters of general interest on which individual members have sought the advice of the Head Office of the British Medical Association)

Professional Secrecy Examination and Consent *

Although a doctor is not entitled to divulge to a third party any information obtained by him in the course of his attendance upon a patient without the patient's knowledge and consent there are cases in which such consent must be understood to be implied, such as that of giving any information which a practitioner is expressly required to give under the provisions of any statute or by direction of a judge in the course of evidence in a court of justice Information given to insurance companies against whom patients may have claims would not fall under such a category Consent may be taken as implied in cases where medical history sheets are filled up by the medical officers in the various Services Difficulties sometimes arise in connexion with hospital work—for example, when a house surgeon who has rendered a report on a patient of the institution to an outside body is asked to give the committee of the institution access to the report This should not be granted unless the patient s specific consent has been obtained

Practitioners are sometimes asked to furnish reports as to the nature of a patient s illness, and as such reports are frequently required in the interests of the patient any professional difficulty that may arise may be got over by handing the report to the patient and leaving him to make what use of it he thinks fit If, however, the case is one in which the report must be sent direct—for example, to the Ministry of Pensions—the patient s consent should always be first obtained

In connexion with reports to insurance companies, etc it is the practitioner s duty simply to report the condition he finds, including the full nature of the disease, but he should avoid stating any opinion as to how the patient acquired the disease and should decline to report as to whether or not the disease was in his opinion due to the patient s misconduct He should be careful to avoid giving the patient grounds for an action for libel If the report is to contain anything condemnatory—for instance, a statement that the doctor thinks the patient is malingering or behaving fraudulently—the doctor should write the report personally and not dictate it to a secretary Although the doctor may write anything he sees fit, so long as it is true and he writes it in good faith, to persons entitled by their interest in the matter to receive his report, the privilege does not cover the defamatory matter if it is "published to some other person If the doctor prepares the report with his own hand and writes the word "Confidential" on the top and on the envelope he is secure, and if the report is afterwards seen by some unauthorized person the publication will be accidental and the doctor will not be open to an action In cases of life insurance examination the consent of the patient to the sending of the result of the medical examination to a third party (the insurance company) may be taken as implied

A practitioner should not examine a servant on behalf of an employer without the consent of the servant and without taking care, before the examination is made, to see that the servant understands quite clearly that the examination is being made on behalf of the employer, and that the results of the examination will be conveyed to the employer An examination on behalf of a third party without the consent of the person concerned might involve the practitioner in an action for damages No order to examine a person—for example, a prisoner—given by a magistrate, police officer, coroner, or other authority can relieve the medical practitioner of his personal liability, and if he acts under such an order without the patient s consent he does so at his own risk The practitioner must tell the person concerned that he has the right to refuse examination, and that if he consents the result of the examination may be used as evidence against him In the case of an examination of a child under age the consent of the parent must first be obtained, and the results of the examination may be disclosed to the parent No parent or other relative has any right to demand the result of a medical examination of a person of full age

The practitioner must bear in mind that the withholding of knowledge he has obtained in connexion with his professional relationships with his patient may prejudicially affect an innocent third party, and this being so he should do all in his power to induce the patient to disclose the information himself In certain circumstances the practitioner may consider it necessary, if the patient refuses his advice, to take the law into his own hands, but the consequences both of telling what he knows and of keeping silence must first of all be weighed in the balance Besides committing a breach of professional ethics the doctor who divulges professional confidence may also expose himself to an action for libel or slander if the matter which he divulges is defamatory

* Continued from p 70

that a considerable number of viruses can be cultivated on the developing egg but also that this new technique is available for accurate virus titration the detection of viral antibody in sera, and cross immunity experiments The chorio allantoic membrane can in fact replace the experimental animal almost entirely in the study of many viruses For much of this knowledge we are indebted to Dr F M Burnet Many of the papers published by him during the last two or three years have been devoted to this aspect of virus research and he now gives us the fruit of this extensive experience in a report to the Medical Research Council[1] Here will be found set out with admirable clarity the technical details of this method and information concerning the various human and animal viruses which can be grown and studied in this way Many of the observations published in this report have not appeared elsewhere thus adding considerably to its value The advantage of this new method is not merely that the egg is cheaper and less troublesome than using animals it does away with many defects inherent in the latter method No longer need the worker fear that the activation of dormant infections or the occurrence of cross infections will intervene to ruin his experiments, for the egg membrane technique is free from these defects Further as Burnet points out the egg can be employed for the production of bacteriologically sterile virus for immunization purposes already vaccinia virus grown by this method has been used for the vaccination of man And since these cells of the chorio allantoic membrane are susceptible to such a surprising variety of viruses it is perhaps not too optimistic to hope that the list will be extended to include some human viruses which have resisted transmission to animals and so very largely eluded study

PLAGUE IN PARIS

The history of plague, its epidemiology, and the discoveries in regard to its transmission upon which are based our measures of prevention make some of the most fascinating reading in medicine A hitherto unwritten chapter in the story of the disease by Joltrain (Medecin Inspecteur des Epidemies) has now been published[2] in which is given an account of the outbreak of plague in Paris towards the end of the war On December 3 1917, a child was admitted to Brettoneau Hospital suffering with an axillary bubo from which by gland puncture an organism morphologically identical with *B pestis* was recovered As no case of plague had been reported at the time (Paris had been immune from the disease for nearly 300 years) and as the patient died immediately afterwards no further investigations were carried out and the facts were not recalled until June 1920, when a similar case came under observation and the organism was definitely identified at the Pasteur Institute Joltrain was then placed in charge notification was put into effect arrangements for anti plague inoculation of all contacts instituted and a method of diagnosis by a fixation reaction devised Four foci were discovered in the suburbs lying to the north of Paris from west to east—Levallois Clichy Saint Ouen and Panin The total number of cases notified in 1920 was 106 in ninety one of which the diagnosis was confirmed Among fifty two cases treated with anti plague serum the mortality was 6 per cent among the untreated 80 per cent Those affected belonged for the most part to the very poor class miserably housed in rat infested quarters and employed in the rag and bone trade In the years 1921 1922 1923 and 1924 ten five, seven and eleven cases occurred respectively, with odd cases in the subsequent ten years but none in 1935 and 1936–7 That rat epizootic persists at the present time is almost certain though no infected animals have been found since 1934 In a footnote to the article a source of difficulty in this work is mentioned one which is not present in this country As soon as rats were caught in traps set down by the sanitary authority they were immediately taken and sold by the local inhabitants for three or four francs apiece to the "ratodromes' Few of our readers perhaps, are familiar with these rendezvous where one may back one's fancy among rat killing terriers The author appears to believe that the epidemic had origin in the escape of infected rats from a boat which arrived in the Seine near Paris from India having picked up a cargo of coal in England en route This suggestion however should be received with reserve the facts do not appear to warrant this belief

A DISCLAIMER

Various members who have communicated with the British Medical Association regarding approaches made to them by representatives of the Consolidated World Research Society have stated that such representatives informed them apparently as an inducement to them to purchase the *Consolidated Encyclopaedia* and to subscribe to the so called "research services,' that the society is recognized by the British Medical Association If the use of the word 'recognized" is intended to connote approved we desire to make it clear that there is no justification for this statement Moreover many members have informed the Association that they signed the society's contract in the belief that they were purchasing an encyclopaedia of medical knowledge Such is not the case indeed the society in one of its letters writes as follows 'We do not understand the comments contained in your letter and reply as the books themselves do not purport in any way to be medical or surgical In December last the Consolidated World Research Society Limited instituted proceedings against a medical man practising in Sussex claiming the sum of £18 said to be due under a contract signed by this doctor for the supply of the *Consolidated Encyclopaedia*' The conduct of the defence was assumed by the Medical Defence Union and a defence was filed repudiating liability on the ground that the defendant had been induced to enter into the contract by fraud and wilful misrepresentation by the plaintiffs' representative A few days before the date for the hearing notice was given on behalf of the plaintiff of the withdrawal of the claim We think it desirable that these facts should be brought to the knowledge of the profession

[1] Medical Research Council Special Report Series No 220 London 1937 H M Stationery Office
[2] *Bull Acad Med* Paris 1936 116 601

possibly another practitioner to the medical officer of health of the district in which the patient previously lived Dr Lissant Cox expresses the opinion that

'the efficiency of notification in England varies directly with the efficiency of the county council or county borough council scheme dealing with tuberculosis If there is really no comprehensive scheme if there are poor and newly qualified part-time and badly paid tuberculosis officers if there are insufficient means for expert diagnosis and too few beds for treatment, then a high proportion of non-notified fatal cases will be the rule and not the exception'

Dr Maitland Radford reporting to the St Pancras Borough Council finds that the reasons that the disease has not been notified before death are (1) sudden death of a person who has not consulted a doctor since tuberculosis developed, (2) sudden death of a person who has been notified elsewhere but has not consulted a doctor since arrival in the borough, (3) difficulty in diagnosis before death, (4) the doctor being under the erroneous impression that the case has been notified in the borough previously

Dr H Osborne, medical officer of health for the city of Salford, in his annual report for the year 1935 deals not only with the point of non-notification, but also with the somewhat related case of notification only a short time before death

'The fact that many cases of pulmonary tuberculosis reach a comparatively advanced stage before notification is very often due to the late period at which the patient seeks the advice of the general practitioner It is a remarkable fact that pulmonary tuberculosis can reach widespread distribution in the lungs without producing symptoms sufficiently striking to cause the person affected to seek advice, and it is often difficult to make patients and their friends believe that serious disease is present in the chest Improvement in this respect can only be brought about by propaganda work and all opportunities are taken by tuberculosis officers to give lectures and talks to various local organizations and by window displays at the health office to bring before the public a knowledge of the early signs of tuberculosis At the same time it cannot be too strongly emphasized that inadequate medical examination when a patient consults his doctor is bound to result in failure to recognize tuberculosis at an early or curable stage It is pleasing to note that the percentage of cases of pulmonary tuberculosis not notified before death is gradually decreasing from year to year It is regretted that the percentage of fatal cases notified within three months of death during the past year shows an increase on the previous years figures There is reason to believe that some patients in a superior social position do not wish the fact that they are suffering from tuberculosis to be known to the public authorities From time to time efforts are made to bring to the notice of medical practitioners of the city that it is their statutory duty under the Public Health Regulations to notify all cases as soon as they come to their notice

With regard to the point that some patients do not wish the disease notified so as to avoid being brought within the sphere of the activities of the local health authorities, it should be appreciated that it is not uncommon for the notifying practitioner to endorse his notification "for statistical purposes" or with something similar, which will result in no steps being taken by the officers of the health authority before consultation with the notifying practitioner

Public Health Medical Service

The following changes have recently been made in the public health medical service staffs

Dr S I Ballard to be assistant medical officer for mental hospital services in the Isle of Man

Dr J M Watt, medical officer of health for Shipley to be medical officer of health and school medical officer for Kiveton Park Rural District Council and Rotherham Rural District Council

Dr C H Hosben medical officer of health for Swinton and Pendlebury, Lancashire to be medical officer of health for *Tottenham*

Dr W G Patterson, medical officer of health for Barnsley to be deputy medical officer of health for Surrey County Council

Dr S G Gibson, medical officer of health for Launceston has resigned

INSURANCE MEDICAL SERVICE WEEK BY WEEK

Secretary to the Department of Health for Scotland

Mr W S Douglas, who succeeds Mr John E Highton as Secretary to the Department of Health for Scotland (Mr Highton has been appointed Permanent Under Secretary of State for Scotland in succession to Sir John Jeffrey, retired) is a newcomer to national health insurance He brings to Edinburgh, however, a sound judgement and wide experience, and an engaging personality which should be very acceptable to the practitioners and others engaged in national health insurance with whom he will come into contact

Medical Benefit for Workers under 16

A Scottish note on this question appears in the February issue of the *Journal of the National Association of Clerks to Insurance Committees* It is as follows

'Dame Rumour is abroad It is known that immediate legislation is pending whereby boys and girls under 16 years of age who have left school and entered insurable employment will be brought within the existing scheme of national insurance particularly in so far as medical benefit is concerned The difficulty that is meanwhile facing interested parties is to determine the scale of payments to be made to doctors for the treatment which they will be called upon to give to those newcomers Negotiations have already been proceeding between representatives of the medical profession and the central authorities responsible for the financial conditions applicable to these youthful workers A regrettable amount of secrecy prevails with regard to the negotiations The B M A representing the medical practitioners side of the discussion, has lifted the veil of secret diplomacy to some extent but the Government negotiators are still maintaining a sphinx-like silence as to their side of the financial problems involved

In many respects the conditions prevailing resemble the somewhat hectic atmosphere that preceded the advent of national insurance medical benefit in 1912 The scale of capitation fee to be paid to doctors for the treatment which they will be called upon to provide for the industrial recruits under 16 years of age is understood to be the chief bone of contention Are doctors to be paid the same capitation fee for the insured minors as they are meanwhile receiving for insured persons of all ages? The doctors through their formidable official organization plead that the work they will be called upon to do for the new class of insured patients will be at least as deserving of a capitation fee of 9s each patient per annum as for existing insured adults The rival contention is that in certain respects work will not be so onerous as doctors are called upon to perform meantime It is pointed out for instance, that they will not be called upon to issue certificates for their younger patients, and that children between the ages of 14 and 16 do not usually require the same amount of medical attention as their elders So the ancient game of battledore and shuttlecock proceeds merrily

changing into a man which produced in her a state of terror There may be a lack of modesty, a masculine outlook an indifference to or a complete loss of sexual desire and in a few deviation of the sexual instinct to homosexuality

There may be acneiform eruptions, and, rarely, greyish spots of pigmentation on the forehead axillae and back An abdominal mass may sometimes be palpable in those cases associated with a tumour It is unusual to find metastases, but when they occur they are situated in the bones lungs and liver Occasionally there is osteo porosis There may be vascular hypertension, hyper glycaemia, and glycosuria The basal metabolic rate, which varies considerably, is often slightly increased

AFTER THE MENOPAUSE

The clinical picture in these cases is not so well marked, as hirsuties may be absent Obesity is common in most patients, who occasionally suffer from menorrhagia.

Diagnosis

A palpable tumour in the renal region is good evidence that the disturbance is of adrenal origin, in many cases, however, no such sign is present Recently a method of demonstrating the suprarenals by x rays has been devised Air is introduced into the perirenal fascia and its position observed by means of an x ray film The mass of air is then forced by manual pressure into the tissues surrounding the suprarenals The best results are obtained by an x ray film taken eighteen to twenty four hours later By this means suprarenal enlargement may in some cases be detected Another method is to determine the position of the kidneys by x ray examination after intravenous uroselectan

The diagnosis of precocious puberty as a manifestation of the adreno genital syndrome may be difficult in the absence of a palpable adrenal tumour, and the condition must be differentiated from those cases associated with pineal tumour lesions in the region of the hypothalamus and mid-brain, ovarian granulosa cell tumour, and testicular tumour, all of which are extremely rare In girls a reversion to the masculine form, hirsuties, and amenorrhoea are in favour of an adrenal origin Pineal tumours are not as a rule associated with virilism and occur in boys whereas adrenal virilism is commoner in girls In addition to increased skeletal growth precocious development of the external genitals, and obesity pineal tumours may give rise to such disturbances as somnolence psycho logical changes, deafness, blindness, ocular palsies, and symptoms and signs of increased intracranial pressure Localizing signs may also be present in cases of tumour in the region of the hypothalamus and third ventricle Granulosa-cell tumours, which arise from granulosa cell rests in the ovary, have a feminizing influence They are generally unilateral, vary considerably in size and usually occur in elderly women, in whom they cause uterine bleeding In the few cases which have been described in children they produce a precocity characterized by increase in skeletal growth, premature development of the feminine form, premature growth of the mammary glands external genitals, and uterus, and periodic uterine bleeding The precocious appearance of axillary and pubic hair has also been observed It must be noted that in the false precocity of the adreno genital syndrome premature development of the mammary glands and uterine bleeding are rare features

When the obese type of the adreno genital syndrome appears in adults the most important condition from which it has to be distinguished, if this be possible, is Cushing's syndrome a pluriglandular disturbance ascribed by Cushing to an increase of the basophil cells of the anterior pituitary with secondary adenomatous or hyperplastic changes in the suprarenal cortex The group of cases of pluriglandular disease described by Achard and Thiers as 'diabetes of bearded women, and characterized by hirsuties, obesity amenorrhoea, hypertension, cutaneous striae, and glycosuria, have features similar to those of Cushing's syndrome In the cases that came to necropsy pituitary or adrenal tumours were found it is disputed whether such cases should be considered examples of Cushing's syndrome or are types of the adreno genital syndrome Cases of the adreno genital syndrome have been described which were practically identical with Cushing's syndrome and in which at necropsy an adenoma of the adrenal cortex was found and no increase in the basophil cells of the anterior pituitary Langdon Brown, two years before Cushing described his syndrome, remarked on the similarity of the signs produced by lesions of the anterior pituitary and the adrenal cortex Clinically, and even patho logically it may be impossible to reach a definite conclusion

Masculinization is also caused by the rare ovarian tumour termed "arrhenoblastoma,' which arises from undifferentiated cells in the rete ovarii and has the structure of testicular tubules In women with this tumour menstruation ceases and the breasts atrophy there is a considerable growth of hair on the face and sometimes on the chest, abdomen and extremities the clitoris enlarges the voice may become deeper, and the configuration of the body approaches the masculine type

Treatment

Laparotomy should be performed and if a suprarenal tumour is found it should be removed When a tumour is not found Broster removes the larger suprarenal with good results in post pubertal virilism Within a few days of the operation the excessive hair begins to be shed and can be pulled out with little or no pain The mental outlook changes to the feminine type the breasts develop, and normal menstruation returns The results in pre pubertal cases are disappointing probably because the changes are more fundamental and long standing Some patients with precocious puberty however have improved after the operation—hair growth has become normal the obesity has diminished, and the body has assumed more childlike form but in a recent case of precocity in a boy of 5 the external genitals did not diminish in size

Medullary Tumours

Phaeochromocytoma (Hyperchromaffinism)—This form of tumour which is somewhat rare is usually not malignant, and consists of highly differentiated chromaffin cells which secrete adrenaline or some allied compound About half of the cases are associated with paroxysmal or continuous hypertension A paroxysmal hypertensive attack is characterized by the sudden onset of dyspnoea tachycardia headache pallor and a feeling of constric tion about the heart and epigastrium often accompanied by nausea vomiting and apprehension There may be glycosuria and hyperglycaemia Pulmonary oedema may occur and coma due to hypertensive encephalopathy Sudden death has been reported in some instances At the height of an attack there may be a sudden fall of blood pressure which is accompanied by flushing of the face, contraction of the pupils profuse sweating and salivation A tumour may be palpable in the renal region or displacement of the kidney by a tumour mass may be

SUPPLEMENTARY RESERVE OF OFFICERS ROYAL ARMY MEDICAL CORPS

L H Leiman to be Lieutenant

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

The date of promotion to Major of Major and Brevet Lieut.-Colonel A Topping T D, is May 6, 1932, and not as notified in the *London Gazette* of October 14 1932

Captain W L Kinnear to be Major

Lieutenants T Senger and I L Cowan to be Captains

To be Lieutenants W Graham, late Officer Cadet Sergeant, Queen's University, Belfast Contingent Senior Division O T C, B Crosthwaite, J S Miller G F O'Connor, late Under Officer, Beaumont College (Old Windsor) Contingent Junior Division O T C

INDIAN MEDICAL SERVICE

The services of Lieut.-Colonel F A Barker, O B E, have been replaced at the disposal of the Government of the Punjab

Lieut.-Colonel G Covell officiating Director, Malaria Survey of India, on foreign service under the Indian Research Fund Association has been granted leave and his services are replaced at the disposal of the Director General Indian Medical Service as from the date on which he proceeds on leave

Majors H Williamson O B E and N M P Dotiwala, M C to be Lieutenant-Colonels

The promotion of Major R A Wesson to his present rank has been antedated to April 30 1935 He qualified for accelerated promotion on September 7, 1936

Major H W Mulligan officiating Assistant Director Central Research Institute Kasauli has been placed on foreign service under the Indian Research Fund Association to officiate as Director Malaria Survey of India

Captain W Scott to be Major

Captain E A O'Connor has been temporarily employed to officiate as an Agency Surgeon as from October 22 1936 and has been posted to the North West Frontier Province

The services of Captain S T Davies have been placed temporarily at the disposal of the Government of Madras, as from December 2 1936

The services of Captain F W Allinson have been placed temporarily at the disposal of the Government of Bengal as from November 13, 1936

Lieutenants (on probation) to be Captains (on probation) V D Gordon B de Burca, D R Nicol J Morgan G R C Palmer A C Taylor J Revens T Sommerville, and L M Kelly

To be Lieutenants (on probation) M C L Smith W Lunnie, B M Wheeler A H W Mitchell C H Bliss B J Dorin (seconded) R B Davis F MacD Byrn (seconded) J H Cater, and J D Munroe (seconded)

COLONIAL MEDICAL SERVICE

equipped for general gynaecological work or as a place for the treatment of sick women But if they were the result might be that their preventive functions would be impaired by being mixed up with work which usually needed the resources of a hospital for its adequate performance He did not therefore think that in ordinary circumstances it was desirable that a gynaecological clinic should be established at a maternity and child welfare centre, though he recognized that some local authorities with their knowledge of local conditions might feel justified in taking a different course

Report Awaited

With regard to the encouragement of further gynaecological clinics Sir Kingsley Wood said he hoped shortly to receive the report of the last two years investigation into the problem of maternal mortality He had little doubt that one of its most important recommendations would relate to the need for an extension of post natal clinics At these clinics facilities would be available for medical examination and certain minor forms of treatment for women who had recently been confined, and birth control advice could lawfully be given there to any such woman in whose case pregnancy would be detrimental to health, but it was desirable that such advice should be given at a separate session The establishment of post-natal clinics would no doubt show the need in many areas for providing gynaecological clinics for the treatment of disabilities and diseases which were discovered at the post-natal clinics and which could not be adequately treated there These gynaecological clinics must be provided under the Public Health Acts, and they would be available for any woman suffering from gynaecological conditions and birth control advice could lawfully be given at such clinics to any woman for whom pregnancy would be detrimental to health He thought that the most suitable place for a gynaecological clinic was a women's hospital or a general hospital, but he would carefully consider all that the deputation had said and what should be included in the circular to local authorities following the recent investigation into maternal mortality, and particularly on the need of gynaecological clinics to supplement the work undertaken at post natal clinics

With regard to the subject of abortion he had no doubt the report on maternal mortality would deal with this question and he would have to consider what action was desirable in the light of the report

THE MEDICAL ILLUSTRATOR

AN ALLIANCE OF ART AND MEDICINE

The article printed below has been written by a professionally trained technical artist in London

The anatomical illustration of medical subjects has a history that reaches from pictorial antiquity up to the present day It ran parallel with some of the oldest manuscripts, and, like them developed laboriously out of necessity for a clearer representation of facts The rudiments of this art lay either in the hands of a draughtsman who knew nothing of the actual subject or in those of an anatomist who had no feeling or power of artistic expression As long as these two did not see eye to eye the result was disastrous In the former case the drawings though pleasing to look at, were often utterly misleading, in the latter case the forms depicted were not only ugly but incomprehensible to all save the author, who tried to overcome his handicap by lengthy text descriptions Examples are to be seen of course in any of the earlier medical books

At the end of the fifteenth century when the curiosity and attention of the artists awakened to form they sought the solution of their problems in a close observation of nature, and were compelled to perform dissections of domestic animals and the human body Medical men, seeing the work of the artists, were urged to more careful and accurate study, they became forced to trust their own interpretations and break away from the Galenical traditions which had enslaved them for three centuries Vesalius, the father of present day anatomy employed Jan Van Kalkar (a skilled artist and a pupil of Titian) and by constant supervision directing the eye the hand, and the intelligence of the artist, a pleasant union of the two subjects was formed

A Twofold Field

It has taken the medical profession centuries to realize the obvious fact that skill and knowledge in this dual field of illustration should not be separated the one must be animated by the other, and the two harmoniously combined Even to day this has not been fully appreciated In England and France throughout the great hospitals, clinics and medical schools there are very few professionally trained technical illustrators apparently their necessity is not admitted and on looking through the periodicals one might surely wonder why such crude figures have been introduced at all Germany appears first to have realized the advantage of such artists, its medical books hold high place for though many practitioners may have difficulty with the text the pictures are so graphic and precise that they are self explanatory America stands on a par with Germany and many of its books published during the last thirty years are beautifully and clearly illustrated We are not here criticizing the excellent figures in purely anatomical textbooks so much as those of the modern wider world of clinical books and articles, though the complete artist must be capable of handling both specialties

Photography has invaded this field to a certain extent, but the camera, even in competent hands, can only reproduce what is exactly placed before it It cannot repair an artefact or reconstruct a whole specimen where a section has been removed for pathological analysis, it has not the power of intelligent selection or elimination of unessential points nor can it explain a mechanical change of events in the way that an artist can by a well-planned diagram Likewise, photographs of soft post-mortem tissues are seldom satisfactory such specimens can best be illustrated by a reconstructed drawing Further, when it is not possible to photograph an actual subject, a drawing can show the variations which may occur in one disease and help to distinguish it from another giving a somewhat similar appearance

Special Training and Experience Needed

To day this special profession of medical art is becoming more practised The training is long and arduous it requires infinite patience and an inquiring mind The art student must have drawn from life to the stage where he has mastered an understanding of the form and means of expression then he must spend a long period of time in the study of the human body under the direction of a competent anatomist and make careful drawings from dissections prepared by himself He must be familiar with the normal body first, and then the picture presented by the abnormal or diseased and be able to recognize the gross changes so wrought and distinguish the subtle changes that differentiate one disease from another His training must include the reading of tissue preparations under the microscope histological as well as pathological and he must know their appearance so well that he can recognize and reconstruct an artefact With experience he can interpret the views he sees through the different scopes when examining the retina the bronchial tubes the ear drum etc He needs a knowledge of surgical technique in order to be able to sketch quickly and make note of what is done during operations he must know and abide by the strict rules of asepsis that are law in an operating theatre His visual memory must be trained to observe and accurately record minute detail and reproduce slavishly even the texture of what he sees His work

based upon early experience Sometimes much could be learned from the mere recital of experiences remembered by the patient, these might suitably engage the attention of the family doctor But often the pattern of childhood was influenced by a memory or memories unremembered by the patient and these would require more technical treatment Examples of fear guilt, and inferiority in early childhood were quoted, with special reference to lactation trauma, masturbation and illegitimacy

The contrast between resultant and purposive neuroses was stressed and illustrated There followed in conclusion a brief formulation of hysteria and anxiety

On the motion of DR FERGUS R FERGUSON seconded by DR R G MCGOWAN a vote of thanks was accorded DR Crichton Miller

LANCASHIRE AND CHESHIRE BRANCH PRESTON DIVISION

A joint meeting of the Preston Division and the Preston Medico Ethical Society was held at Preston Royal Infirmary on January 12 when Professor HENRY COHEN (Liverpool) delivered a lecture on Parkinsonism A lively discussion followed

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION

At a meeting of the North Northumberland Division held at Belford on January 20 DR F J NATTRASS (Newcastle-upon-Tyne) gave an instructive address on Points in the Diagnosis of Spinal Diseases

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following surgical tutorial classes at National Temperance Hospital at 8.30 p.m., on Tuesdays and Thursdays February 16 neck February 18 skull and brain February 23 liver spleen and pancreas February 25 large intestine and rectum A special course for the primary F.R.C.S. examination will be given at Infants Hospital on Mondays Wednesdays and Fridays from February 22 to May 24 A general practitioners course in medicine surgery and gynaecology will be given at Royal Waterloo Hospital from February 22 to March 6 A week-end course will be given at Princess Elizabeth of York Hospital for Children February 20 and 21 Other courses will be given as follows proctology at St Mark's Hospital March 1 to 6 orthopaedics at Royal National Orthopaedic Hospital March 8 to 20 clinical and pathological course, at National Temperance Hospital Tuesdays and Thursdays at 8 p.m. February 16 to March 14 chest diseases at Brompton Hospital twice weekly at 5 p.m. February 22 to March 20 heart and lung diseases at Royal Chest Hospital, Mondays, Wednesdays and Fridays at 8 p.m., March 1 to 20, neurology, at West End Hospital for Nervous Diseases, March 8 to 20

A three-months course in clinical practice and hospital administration will be given at the Brook Hospital Shooter's Hill S.E. by Dr J. V. Armstrong on Mondays and Wednesdays at 10 a.m. and alternate Saturdays at a time to be arranged beginning April 5 It is intended for those studying for the D.P.H. and complies with the requirements of the General Medical Council's revised regulations which came into force on October 1 1931 A course may, however be taken under the previous regulations for £4 4s The fee (£3 13s 6d.) should be paid to the medical officer of health, L.C.C. Public Health Department (Special Hospitals), County Hall S.E.1

A series of post graduate lectures by members of the hospital staff began at the Hampstead General and North West London Hospital on January 27 The lectures will be continued on Wednesdays at 4 p.m. until March 31 Details will appear in the post graduate diary column in the *Supplement* week by week

A series of lectures by members of the hospital staff began at the National Hospital for Diseases of the Heart, Westmoreland Street W. on February 2 and will be continued on Tuesdays at 5.30 p.m. until April 27 The lectures are free to all medical practitioners and senior students and no tickets of admission are required Details will be published weekly in the post graduate diary column of the *Supplement*

The Berliner Akademie fur ärztliche Fortbildung the successor of the Dozentenvereinigung fur ärztliche Fortbildung in Berlin is holding the following international medical post graduate courses internal medicine with special reference to clinics, February 22 to March 6 (fee, RM.75), additional training course for surgeons, April 5 to 10 (fee, RM.70) fourth additional course in occupational diseases, April 5 to 10 (fee, RM.50) special course in urology, April 12 to 17 (fee RM.60), alimentation of man in health and sickness April 12 to 17 (fee, RM.50), important developments in x-ray diagnostics and ray therapy, April 16 to 23 (fee, RM.60) additional course in orthopaedics April 19 to 24 (fee, RM.60) course on tuberculosis in the Berlin Municipal Hospital for Tuberculosis Waldhaus Charlottenburg, May 3 to 8 (fee RM.50) Special courses in all branches of medicine with practical work at the bedside and in the laboratory are held every month In these courses special value is attached to practical work theoretical post-graduate training occupies a secondary position, but is of course not neglected The first eight courses will be held in German and the special courses also in foreign languages For programmes and further information apply to the Geschäftsstelle der Berliner Akademie für ärztliche Fortbildung Berlin N.W.7, Robert Koch Platz 7 (Kaiserin Friedrich Haus) Foreign doctors and German doctors resident abroad are granted a reduction of fare of 60 per cent on the German railways, a foreign doctor can reduce the cost of his stay considerably by utilizing what are called registered marks; it is advisable to arrange matters with the local bank before starting

NOTES OF THE WEEK

Cancer Investigations and Professional Secrecy

Medical officers of health in various parts of the country have recently issued to practitioners in their areas a questionary concerning the medical histories of patients whose deaths from cancer have been notified A request for advice as to the propriety of completing such a questionary has been considered by the Central Ethical Committee of the B M A The view of the Committee is that provided professional secrecy is maintained there is no objection to a practitioner supplying the information requested The Committee considers it desirable that the practitioner should ask the relatives of the deceased patient if they have any objection to the information being given and that the patient should be referred to in the questionary by an identification number and not by name

Municipal Midwifery Services

Schemes for municipal midwifery services have been prepared by the local authorities for Smethwick Edmonton, Tottenham and Barking The Edmonton scheme provides for ante natal examinations by a doctor chosen by the patient It is proposed that the doctor selected shall make seven ante natal examinations at an inclusive fee of one guinea which shall be paid by the patient or if the patient is unable to pay by the council If however, the number of ante natal examinations is four or less a fee of 5s for each examination is suggested Medical practitioners will have free access to the council's ante natal clinic so far as their own patients are concerned The Tottenham scheme also provides for ante natal examinations by a doctor selected by the patient and it is suggested that midwives should persuade their patients to seek both ante natal and post natal examinations either at one of the municipal clinics or by the medical practitioner who may be expected to be summoned in the event of the midwife requiring medical assistance at the confinement The Smethwick Borough Council has appointed seven midwives and a senior midwife who will exercise clinical supervision over the others Salaries for midwives are to be arranged in two scales one for midwives who are both State registered nurses and State registered midwives and the other for those who are certificated as midwives only The scheme provides for ante natal and post natal examinations to be performed either in the patient's home or at the council's clinics It is noted that 90 per cent of the expectant mothers in the borough already attend the council's ante natal clinic

The Journal of the A M A

The *Journal of the American Medical Association* since the first issue of 1937 has included a special section which will serve a purpose similar to that of the *Supplement* to the *British Medical Journal* This regular section supersedes the monthly bulletin previously issued to Fellows of the Association and it will include articles dealing with the organizational economic business and social aspects of medical practice reports of the activities of the American Medical Association and the Woman's Auxiliary and notices of official meetings

Fees for Diphtheria Immunization

As a result of representations made by the Northern Ireland Branch of the B M A the honorary secretary has received a letter from the Minister for Home Affairs stating that a circular is to be issued to local authorities recommending the payment of a fee of 2s 6d per injection instead of 2s 6d per case to doctors performing diphtheria immunization As two injections in each case have been recommended the new arrangement represents a total payment of 5s per case

Melbourne Chess Cup

Mr W McAdam Eccles is acting as honorary chess secretary for the Metropolitan Counties Branch and members of the Branch who are interested in this competition are asked to communicate direct with Mr McAdam Eccles *not later than February* 22 at 104 Bryanston Court London W 1

Dr D Rocyn Jones medical officer of health for Monmouthshire has been presented by the local committee for maternity and child welfare and the blind with a framed portrait of himself as an expression of appreciation of his sympathetic interest in the committee's work

Dr J C Sykes whose family has carried on practice at Gomersal, Leeds for a hundred years has retired

KING'S LYNN WEST NORFOLK AND KING'S LYNN GENERAL HOSPITAL—H P Salary £125 p a

LEEDS MATERNITY HOSPITAL AND HOSPITAL FOR WOMEN—Joint Pathologist Salary £600 p a

LEICESTER ROYAL INFIRMARY—(1) Resident Anaesthetists Salaries £150 £250 p a each (2) H S s (3) H P s (4) C O's Salaries £125 p a each

LIVERPOOL CITY—A M O (female) Salary £500 £25 £700 p a

LIVERPOOL COUNTY BOROUGH—(1) Junior Assistant School M O for Aural Work (2) Junior Assistant School M O Salaries £500 £25 £700 p a

LONDON COUNTY COUNCIL—A M O s (Grade II) for (*a*) Bethnal Green Hospital, E (two positions), (*b*) Lambeth Hospital, S E, (*c*) Norwood Hospital for Children, S E, (*d*) Queen Mary's Hospital Sidcup (two positions) (*e*) St Andrew's Hospital, E, (*f*) St Giles Hospital S E, (*g*) St James Hospital, S W, (*h*) St Mary, Islington Hospital, N, (*i*) St Peter's Hospital, E Salaries £250 p a each (*a*), (*b*), (*d*), (*h*), and (*i*) are male appointments only (*c*) female appointment only

LONDON HOSPITAL E—(1) Paterson Research Scholar and Chief Assistant in the Cardiac Department Salary £400 p a (2) First Assistant in the Department of Thoracic Surgery Salary £150 p a

LOWESTOFT AND NORTH SUFFOLK HOSPITAL—J H S (male) Salary £120 p a

MACCLESFIELD GENERAL INFIRMARY—Senior H S Salary £180 p a

MANCHESTER ANCOATS HOSPITAL—Orthopaedic H S Salary £100 p a

MANCHESTER CHRISTIE HOSPITAL AND HOLT RADIUM INSTITUTE—Whole time Assistant Director of the Radium Institute Salary £1,000 p a

MANCHESTER DUCHESS OF YORK HOSPITAL FOR BABIES—(1) Senior R M O (2) J R M O Salaries £125 p a and £75 p a respectively

MIDDLESBROUGH NORTH ORMESBY HOSPITAL—H S (male, unmarried) Salary £135 p a

MILDMAY MISSION HOSPITAL, Bethnal Green, E—J R M O (male) Salary £100 p a

MILLER GENERAL HOSPITAL Greenwich Road, S E—(1) Part time C O (male non resident) (2) H S (male unmarried) Salaries £150 p a and £100 p a respectively

MITCHAM WILSON HOSPITAL—R M O Salary £150 p a

NATIONAL DENTAL HOSPITAL University College Hospital W C—Hon Assistant Anaesthetist

NELSON HOSPITAL Merton, S W—R H S (male, unmarried) Salary £100 p a

NEWCASTLE UPON TYNE EYE HOSPITAL—Senior H S Salary £300 p a

NEWCASTLE UPON TYNE NORTHUMBERLAND COUNTY COUNCIL—A M O (unmarried) for Wooley Sanatorium Salary £350 £25-£450 p a

NEWCASTLE UPON TYNE ROYAL VICTORIA INFIRMARY—(1) Medical Registrar (non resident) Salary £250 p a (2) Morning List Anaesthetist Salary £1 5s per session

NEWNHAM WEST GLOUCESTERSHIRE UNITED DISTRICTS COMMITTEE—M O H for the Rural Districts of East Dean, West Dean, and Lydney Salary £800 p a

NORTHAMPTON MENTAL HOSPITAL Berrywood—Third A M O (male, unmarried) Salary £450 £25 £500 p a

NORWICH NORFOLK AND NORWICH HOSPITAL—H S (male, unmarried) to the Special Departments Salary £120 p a

NOTTINGHAM AND MIDLAND EYE INFIRMARY—R H S Salary £200 p a

PALESTINE ST LUKE'S HOSPITAL Hebron—A R M O (female) Salary £160 p a

PENDLEBURY ROYAL MANCHESTER CHILDREN'S HOSPITAL—Non resident A M O for the Out patient Department Salary £150 p a

PLYMOUTH PRINCE OF WALES'S HOSPITAL Devonport—Senior H S Salary £130 p a

PLYMOUTH PRINCE OF WALES'S HOSPITAL Greenbank Road—(1) H P (2) H S Salaries £120 p a each

POOLE CORNELIA AND EAST DORSET HOSPITAL—Hon Assistant Ophthalmic S

POPLAR HOSPITAL FOR ACCIDENTS East India Dock Road, E—Second Resident Officer (male) Salary £175 p a

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY—H P Salary £150 p a

PRESTON LANCASHIRE COUNTY COUNCIL—J H S (unmarried) for Biddulph Grange Orthopaedic Hospital Salary £200 p a

PRINCE OF WALES'S GENERAL HOSPITAL N—(1) J H P (2) Two J H S Males unmarried Salaries £90 p a each

PRINCESS BEATRICE HOSPITAL Earl's Court, S W—(1) R S O (male) Salary £200 p a (2) H P and C O (3) C O and Obstetric H S Salaries £110 p a each

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN St Quintin Avenue W—(1) H P (male) Salary £120 £150 p a (2) Part time Registrar Honorarium £100 p a

QUEEN MARY'S HOSPITAL FOR THE EAST END E—Hon Assistant P to the Department of Psychological Medicine

READING ROYAL BERKSHIRE HOSPITAL—Resident Anaesthetist (male) Salary £250 p a

ROCHDALE COUNTY BOROUGH—J R M O (male unmarried) for Birch Hill Hospital Salary £225 p a

ROCHDALE INFIRMARY AND DISPENSARY—(1) Senior H S Salary £250 p a (2) H P (3) Second H S Salaries £150 p a each

[illegible]HAM HOSPITAL—(1) Senior H S or P (2) H P (3) [illegible]dry H S (males) Salaries £200 p a, £180 p a, and £150 p a [illegible]ctively

ROYAL LYE HOSPITAL, St George's Circus, S E—(1) Senior H S (2) Two Assistant S Salaries £150 p a and £100 p a each respectively

ST ALBANS CLEL BARNES MENTAL DEFICIENCY COLONY—H P Salary £200 p a

ST GEORGE'S HOSPITAL S W—R M O (male) for the Convalescent Branch, Wimbledon Salary £300 p a

ST JOHN'S HOSPITAL FOR DISEASES OF THE SKIN, Lisle Street W C—Medical Registrars to (1) Out patients and (2) In patients Honorariums £50 p a each

SCARBOROUGH (NEW) HOSPITAL—H P (female) Salary £130 p a

SHEFFIELD CITY—A M O (female) for Nether Edge Hospital Salary £350 £25-£450 p a

SHEFFIELD JESSOP HOSPITAL FOR WOMEN—H S (male, unmarried) Salary £100 p a

SMETHWICK COUNTY BOROUGH—(1) Resident Obstetrical Officer (male) and (2) J R M O for St Chad's Hospital, Birmingham Salaries £350 £25 £450 p a and £150 p a respectively

STAFFORD STAFFORDSHIRE COUNTY COUNCIL—Assistant County M O H and M O H for the Stone Urban and Rural Districts Salary £800 p a

SUTTON AND CHEAM HOSPITAL—(1) Senior R M O (2) J R M O Males Salaries £150 p a and £100 p a respectively

TAUNTON AND SOMERSET HOSPITAL—H S Salary £100 p a

TRURO ROYAL CORNWALL INFIRMARY—H S (male) Salary £150 p a

WAKEFIELD WEST RIDING OF YORKSHIRE MENTAL HOSPITALS BOARD—A M O for Menston Mental Hospital, near Leeds Salary £350 £25 £450 p a

WALLASEY COUNTY BOROUGH—Assistant M O H and School M O (female) Salary £400 £25 £600 p a

WEST HAM COUNTY BOROUGH—First A R M O (male) for the Central Home, Leytonstone Salary £525 £25 £600 p a

WEST LONDON HOSPITAL Hammersmith, W—Full time Assistant Pathologist Salary £300 p a

WESTMINSTER HOSPITAL Broad Sanctuary, S W—Surgical Registrar Salary £250 p a

WOOLTON ROYAL LIVERPOOL BABIES HOSPITAL—R M O Salary £125 £150 p a

WOOLWICH AND DISTRICT WAR MEMORIAL HOSPITAL Shooters Hill S E—(1) R M O (2) H S Salaries £175 p a and £100 p a respectively

WORCESTER COUNTY AND CITY MENTAL HOSPITAL Powick—A M O (male, unmarried) Salary £350 £25 £450 p a

CERTIFYING FACTORY SURGEONS—The following vacant appointments are announced Bungay (Suffolk), Tarvin (Cheshire) Applications to the Chief Inspector of Factories Home Office Whitehall, S W 1, by February 23

MEDICAL REFEREE UNDER THE WORKMEN'S COMPENSATION ACT 1925 for the Boston, Holbeach Sleaford Spalding Spilsby and Skegness County Court Districts (Circuit No 17) Applications to the Private Secretary, Home Office Whitehall, S W 1, by March 1

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 52 53 54 55 56 57 58 59 62 and 63 of our advertisement columns and advertisements as to partnerships assistantships and locumtenencies at pages 60 and 61

APPOINTMENTS

FINDLAY Louis, M B, Ch B Assistant Resident Medical Officer Booth Hall Hospital, Manchester

HENNELLY T J M D, D P M, Medical Superintendent, Cardiff City Mental Hospital

RAINER Edwin M D, D P H Consultant Tuberculosis Officer West Riding County Council

WOOD E A M D M R C P Honorary Consulting Physician to the Eversfield Chest Hospital, St Leonards on Sea

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue

MARRIAGES

GREEN—ROBERTS—On February 9, at St Andrews Wells Somerset Mr Philip Green, surgeon, of Brandon House Portsmouth to Violet Agnes Roberts widow of Dr Hamilton Roberts

REID—KERSHAW—On January 23 1937, at St Helen's Church Sandal Magna Alexander Reid, M B, Ch B, D T M D T H of Clare, Suffolk to Gertrude Kershaw of Sandal, Wakefield

DEATH

LEWIS—At Birmingham on February 6 Charles James Lewis M D, M R C S F R C P Ed D Sc Emeritus Professor of Public Health at Birmingham University formerly of Stirling and Edinburgh No flowers

of remuneration and reward for research and inventions by means of patenting and by commercial transactions and on its recommendation the Council eventually submitted a Memorandum of Evidence to the Departmental Committee

There appeared to be two courses whereby the difficulties already mentioned might be overcome One was the abolition of the right to patent medical inventions and discoveries This course, however, could be effective only if all countries simultaneously abolished medical patents by international agreement and such an agreement did not appear to be a practical proposition The other course was the introduction of a system of patents dedicated to the public use This method a scheme to which was brought to the notice of the Association by the Association of British Chemical Manufacturers seemed to offer a practicable solution of the problem, and the Council submitted in its Memorandum of Evidence to the Departmental Committee that the scheme with certain modifications was worthy of consideration It proposed that any medical practitioner who wished to patent a medical invention should be required to dedicate his patent to the British public The patent rights would be exercised by a Medical Patents Trustee appointed for the purpose by the Board of Trade and the funds accruing from the sale of licences would be utilized at the discretion of the trustee either for the promotion of further research or for the reward of the individual inventor

Discussion by Representative Body of the B M A

The proposal however met with severe opposition when it was reported to the Annual Representative Meeting of 1930 and the whole question was referred back to the Council for reconsideration The pros and cons of medical patents were vigorously argued Criticism of the Council's report was based mainly on the contentions that it did not express the general opinion of either medical research workers or the profession as a whole that the scheme of dedicated patents would not achieve the desired object that the traditional professional view of patenting by medical workers was not tenable under modern conditions and that there was no sound ethical distinction between the direct remuneration of a medical research worker by way of royalties under the patent law and that of the clinician by way of patients fees

In reconsidering the matter in the light of the discussion of the Representative Body a joint subcommittee of the Ethical and Science Committees endeavoured to retain what was essential in the ethical attitude of the medical profession and also to take into account first the changes which had occurred during recent years in the industrial aspects of research and the manufacture of medical substances and appliances and secondly the exploitation of the published results of British research by foreign workers who do not hold the same views as British workers on the ethics of medical patents As a result of the deliberations of this subcommittee the Council submitted a resolution to the Representative Body in 1931 After considerable discussion the resolution was eventually adopted in the following amended form

> That the Association approves the traditional professional usage in accordance with which it is unethical for any medical practitioner who discovers or invents any substance process apparatus or principle likely to be of value in the treatment of patients to act against the public interest by unduly restricting the use and knowledge of such discovery or invention for his own personal advantage

This resolution however contributed little to the solution of the practical problems of medical patents and in accordance with the desire expressed by members during the debate, the Council arranged a series of conferences with representatives of the Royal Colleges of Physicians and of Surgeons and the Medical Research Council for the purpose of a further exploration of the subject The members of these conferences formulated a policy which was reported to the Representative Body in 1932, when the adoption of the following recommendations was moved

> 1 That the granting of further patents in the medical field is undesirable in the public interest and the Association would welcome any action to prevent or regulate such further grant by international agreement
>
> 2 That experience has shown that research and discovery have been hindered rather than promoted by the granting of patents for inventions dealing with the following classes of substances used in therapeutics and practical dietetics sera toxins antigens viruses bacteriological products active principles natural to the animal body vitamins The Association considers it desirable in the interests of medical science and practice that no further patents should be granted for inventions dealing with the manufacture of such substances for use in medicine or dietetics If patents are granted for methods of manufacturing such substances for other uses it considers that manufacture for use in medicine should be exempted from the operation of such patents The Association would urge amendment of the law to secure these ends
>
> 3 That the Association is not convinced that the granting of patents for the synthetic preparation of new substances for use in therapeutics has been similarly detrimental It further appreciates the possibility that a one sided and purely national abolition of such patents might unjustly penalize commercial enterprise in this country It would gladly see a mechanism established by which patents for inventions in the medical field other than those specified in para 2 of this recommendation could be dedicated to the use of the public in this country while affording the requisite priority of action in other countries
>
> 4 That until some such dedicatory system is established the special position held by medical men in the community renders it undesirable that they should apply for patents in the medical field

These recommendations gave rise to a prolonged discussion which disclosed considerable differences of opinion on the subject, but a motion to refer the matter back to the Council for further examination and report was defeated by an overwhelming majority Eventually when it had been made clear that the recommendations were not to be regarded as the final conclusions of the Association on the subject and that a practitioner who did not strictly observe them was not to be considered guilty of unethical conduct the following amendment was carried without dissent

> That the Representative Body adopts the report of the Council under the heading Patenting in the Medical Field with its suggestions for the guidance of registered medical practitioners and asks the Council to continue consideration of the subject

Present Position

And there for the present the matter rests The Departmental Committee declined to make any recommendation concerning dedicated patents which it stated had attracted more attention and had been the subject of more conflicting evidence than any other question before it It was of the opinion that no sufficient case had been made out for any compulsory dedication and that such an alteration in the law would operate adversely to the British fine chemical industry and discriminate unfairly against research workers in this country The

anaesthetics he preferred were nembutal, avertin, and paraldehyde, and in that order Having secured basal narcosis he gave gas-oxygen and ether, using only sufficient ether to enable him to pass a Magill nasal tube into the trachea He mentioned the safety of gas oxygen and the simplicity of the method, the value of a suction pump as an aid to both surgeon and anaesthetist, the use of the Davis gag, and the liability of blood to collect behind the soft palate and the prevention of this by means of a special tube

Mr W S THACKER NEVILLE said that for about ten years for all nasal operations he had used deep twilight sleep induced by morphine and scopolamine, with the local application of a paste of cocaine and adrenaline With a few contraindications this proved satisfactory, as the anaesthesia gave him an almost bloodless field, and so allowed the operations to be performed completely and without haste On the introduction of avertin he gave up the use of twilight sleep, and for major operations he adopted avertin with local anaesthesia, with or without intratracheal ether , for minor nasal operations he used evipan preceded by omnopon and scopolamine For tonsillectomies he had used local anaesthesia with the patient in the recumbent position, but more generally he had used paraldehyde followed by ether In children practically all operations were carried out with sodium soneryl as premedication, followed by ethyl chloride and ether Painful dressings were performed under avertin alone, or under sodium soneryl followed by ethyl chloride, or under the momentary anaesthesia produced by a mixture of ethyl chloride and ether Oesophagoscopies and bronchoscopies were carried out under avertin with cocaine paste applied to the pyriform fossae, with or without intratracheal ether

Anaesthesia in Tonsillectomy

Dr A W MATTHEW dealt with two methods of preventing foreign material entering the respiratory tract during anaesthesia for nose and throat operations—namely, by maintaining the defensive reflexes unimpaired, and by the use of an endotracheal tube and packing In his opinion avertin, nembutal, and morphine should not be used with this technique because they tended to impair the defensive reflexes which it was most important to maintain A small dose of evipan sodium could be given with safety A great deal had been written on anaesthesia for tonsillectomy, especially with regard to the avoidance of psychological trauma in children Sufficient stress was not laid on the fact that the average child was very sensible and full of confidence in his elders If the anaesthetist was tactful, and gave the child a truthful explanation of what he was going to do the fear of the unknown would be replaced by tolerance of the known, and there would be no subsequent ill-will or lack of confidence Betrayal of trust was the main factor in causing psychological trauma in the child He favoured for premedication atropine, 1/100 grain, and nothing else Chloroform, if well tolerated by the patient, was the anaesthetic of choice With chloroform the depth of anaesthesia could be altered rapidly to meet the requirements of the surgeon Post-operative vomiting was the exception

Mr D F A NEILSON said that the question of the type of anaesthesia used for any operation must be considered primarily from the point of view of safety and speedy recovery, but other considerations unfortunately clouded the issue such as expense and also the feeling of comfort, which the patient regarded as of supreme importance when faced with an operation Skilled general anaesthesia meant the introduction of an extra specialist expert, or in America, an anaesthetist nurse Unskilled general anaesthesia could not be admitted as an argument against the use of general anaesthesia He presented a few arguments in favour of general anaesthesia as compared with local for an operation such as tonsillectomy These had to be considered apart from the personal feelings of the patient but the patient's general reactions to local and to general anaesthesia were to be respected separately, and the economic consideration had also to be recognized Intranasal operations could be advantageously carried out under combined local and general anaesthesia

Dr JOHN CHALLIS said that the addition of one unnecessary drug, however innocuous to a patient, showed in itself a lack of skill, and should that drug be known to be dangerous, or to increase the period of normal convalescence, its use in normal cases was strongly to be deprecated He was also against the routine use of basal narcosis, especially in operations in which a brisk return of the respiratory reflexes was to be desired The use of scopolamine and morphine, in conjunction with gas oxygen administered through an intratracheal tube formed the ideal technique, being both safe and efficient A special technique was required for major operations in the larynx Two definite suggestions were put forward for discussion (1) Had not the pendulum in favour of heavy premedication swung too far for the safety and well-being of the average patient? (2) Was not the administration of pure gas and oxygen rather a disadvantage than an advantage to the aural surgeon?

General Discussion

Dr ZELBULON MENNELL said that from the anaesthetist's point of view the most important thing was to know his surgeon's technique Just as there were many varieties of anaesthetic administration, so there were many surgical techniques He deprecated the use of the sucker having found it not infrequently keep up haemorrhage from the tonsillar bed In certain cases, especially tonsils and adenoids in children, the psychological element was not considered sufficiently Personally he thought it a dreadful thing to give a child an anaesthetic without premedication, and among premedicaments for children he thought nothing so safe as the old-fashioned paraldehyde A mixture of chloroform and adrenaline was to be avoided, animal experiment had proved it to cause ventricular fibrillation

Mr SCOTT RIDOUT repeated the remark of Richard Gill that of all anaesthetics, to the one who knew how to give it, chloroform was the simplest Dr IVAN MAGILL mentioned certain precautions which should be taken when the Davis gag was used Dr HAROLD SINGTON said that a certain amount of restlessness followed paraldehyde if given too rapidly He favoured large doses of atropine, 1/75 grain, in a child of 10, or even more in the winter when colds were prevalent If atropine was used there was less likelihood of bronchopneumonia Mr SIDNEY SCOTT answered a decided negative to Dr Challis's question whether the administration of pure gas and oxygen was not a disadvantage to an aural surgeon, though he agreed that it was a drawback that the patient after the operation came out very quickly, when it was preferable that he should remain drowsy for some time Mr HERBERT TILLEY said that in his experience one of the chief troubles with anaesthetics was not at the time of administration, but after return to the ward Often the patient appeared to be suffocating, simply due to the fact that the chin was tucked into the chest, giving a kinked airway Much was heard about the tendency with certain anaesthetics to post-operative haemorrhage His plan was to tie the small artery in the upper recess of the tonsil at the time of operation, doing so in all cases whether there was bleeding or not Dr M D NOSWORTHY said that one of the reasons for premedication, apart from the psychological value, was that less anaesthetic was required The patient recovered better from a small quantity of several drugs than from a very large dose of one Personally he thought avertin preferable for premedication

Mr LAYTON, in reply again spoke of the necessity of mental technique There had been retrogression in this as distinct from operative, technique during recent years owing, he believed, to war surgery, when cases came in great numbers to operation and the surgeon was working against time Under civil conditions there could be no excuse for such pressure

PUBLIC HEALTH NOTES

Notification of Tuberculosis

Tuberculosis in all its forms has been notifiable since 1912 Notification is obligatory to day under the Public Health (Tuberculosis) Regulations, 1930, which consolidated and amended the Regulations of 1912, 1921, and 1924 The 1930 Regulations state that, subject to certain provisos,

every medical practitioner called in to visit any person (whether at any institution or otherwise) and every school medical inspector inspecting children attending public elementary schools shall within forty eight hours after first becoming aware that such person or one of such children is suffering from tuberculosis make and sign a notification of the case in the form set forth in Schedule A or Schedule B, as the case may be to the Public Health (Notification of Infectious Diseases) Regulations 1918 and shall transmit the notification to the medical officer of health of the district within which the place of residence of the person is situate at the date of notification provided that a medical practitioner or school medical inspector shall not notify the case under this Article if he has reasonable grounds for believing that the case has in fact already been notified to the medical officer of health of the district within which the place of residence of the person is at the time situate provided further that if notification is required in pursuance of this Article in respect of an in patient at an institution the notification shall be sent to the medical officer of health of the district in which the usual place of residence of the patient is situate Nothing in these Regulations shall apply to or impose any duty or obligation upon any medical practitioner acting in his capacity as (*a*) medical officer of one of His Majesty's prisons or of a Borstal institution a certified reformatory school a certified industrial school a State or certified inebriate reformatory or a criminal lunatic asylum (*b*) medical examiner of candidates for some office or appointment (*c*) medical examiner on behalf of an insurance company to a person proposing to insure his life at the risk of that company (*d*) medical examiner of the passengers and crew of an emigrant ship or (*e*) certifying or appointed surgeon under the Factory and Workshop Acts 1901 to 1920

Under the Regulations medical officers of sanatoria or public assistance institutions must notify those persons suffering from tuberculosis who have been admitted during the week to the medical officer of health of the district within which the places of residences of the persons notified are situate and, in the case of persons discharged other than those transferred to a public assistance institution or a sanatorium to the medical officer of health of the district within which the places of destination of the persons notified are situate Furthermore it is a duty of every medical officer of health on becoming aware that a person who has been resident in his district and who is suffering from tuberculosis has permanently changed his place of residence forthwith to notify the medical officer of health of the district to which the patient has removed The medical officer of health then in addition to learning of cases by formal notification has others brought to his notice by notification from institutions and by information transmitted by the medical officer of health of another district in the case of a transferred patient he also receives posthumous information from death returns—within a few days if the death occurs locally but not until well after the end of the quarter if the death occurs in some other registration area

Cases Unnotified Before Death

In the report for the Ministry of Health for the year 1935–6 reference is made to the number of cases of tuberculosis which are not notified during the patient's life The percentage of new cases of tuberculosis which became known in 1935 otherwise than by formal notification was 12 8

It is unsatisfactory that over the country as a whole the proportion of cases not coming to knowledge until after death remains considerable and shows no signs of real diminution

The Minister would again direct the attention of local authorities concerned to the measures suggested in Circular 1107 for securing earlier notification especially by the development of the educational side of their tuberculosis work It is moreover, important that in those areas where the proportion of cases of tuberculosis not coming to the knowledge of the medical officer of health remains abnormally high from year to year the local authority should consider the question of taking more stringent action on the lines suggested in Circular 549 and should also take every opportunity of reminding medical practitioners of the facilities available under the tuberculosis scheme for the diagnosis of doubtful cases

Circular 549 states

The Minister desires to take this opportunity of impressing upon local authorities the responsibility which attaches to them for seeing that the requirements of the Regulations are fully observed in their districts and I am to state that where (as in the case of a death certified as due to tuberculosis of a person who had not previously been notified under the Regulations) there is prima facie evidence of neglect to notify on the part of the medical attendant immediate steps should be taken by the local authority to obtain an explanation from the medical attendant as to the circumstances under which formal notification under the Regulations was not made If the explanation is not satisfactory it should be borne in mind that the local authority has power to institute proceedings for the recovery of a penalty under Section 1 (3) of the Public Health Act 1896 in cases of wilful neglect or refusal to carry out the Regulations and it appears to the Minister that it may even be desirable to proceed to a prosecution in one or two cases of the kind where the circumstances warrant such action in order to secure the objects of the Regulations

Failure to Notify Some Medical Officers' Views

Dr G Lissant Cox in his report to the Lancashire County Council for the year 1935 on the prevention and treatment of tuberculosis in the administrative county of Lancaster submits that if measures dealing with tuberculosis are to be successful an accurate and complete knowledge of all the existing cases is required and that if cases only become known through the death certificates control of the spread of infection cannot be effected Whereas in 1918 the percentage of non notified cases to the total number of deaths from pulmonary tuberculosis in his area was 18 3 the figure had fallen to 4 1 in 1935 If from the deaths among those who escaped statutory notification are deducted those of persons who were actually known to the tuberculosis officer though not formally notified and also those of persons in public institutions the percentage is reduced to 2 5

He gives a detailed analysis of the cases which had not been notified and finds that the reasons for the failure included the following no doctor in attendance more than one doctor in attendance the disease was of very long duration doubt as to the diagnosis the doctor being in attendance only a very short period before death and misapprehension of the Regulations as the cases had been notified in another area In rapidly developing areas to which many people have transferred this last is possibly the most common reason for failure to notify the disease It is not always appreciated that the case is required to be formally notified to the medical officer of health of the district in which the patient is residing and it is not sufficient that it should previously have been notified by

Further, the contraction process following the make or break of a direct current occupied an appreciable interval of time, perhaps a second or longer This was succeeded by a still more prolonged period during which the contraction was very slow and deliberately subsiding Sir Robert Stanton Woods entered in detail into the various kinds of electrical responses and their significance He disagreed with the statement sometimes made that an electrical examination elicited few if any facts which were unobtainable by other neurological tests There was, for example, the obvious fact that the only positive proof of the hysterical nature of a paralysis was the muscle response to electrical stimulus Moreover, in a paralysed limb the organic and the functional could be accurately segregated Muscle testing would also differentiate between muscles which failed to function owing to pain and those which were affected by a lower motor neuron lesion Again, an accurate mapping out of responses might decide the level of the lesion, for example, it would help to distinguish between a paralysis of the circumflex nerve and one of the fifth root He agreed with Lewis Jones that any deviation from the completely developed reaction of degeneration was important, and that a sluggish response to stimulus by the direct current was diagnostic of a lower motor neuron lesion, even in the presence of excitability by faradism He added that no investigation of such a lesion was complete without an accurate account of skin and other sensibility, of voluntary muscular control, and electrical responses of all relevant muscles by all the means clinically practicable

General Discussion

Mr F H Bentley referred to experiments he had been carrying out at the Royal College of Surgeons in connexion with the surgery of nerve roots The first point concerned the influence of scar formation at the anastomosis of a nerve suture When a nerve was sutured union took place by scar formation, the scar filling the interstices and producing obstruction to the new-growing nerve fibres The fibres were directed by the scar tissue rather than in a new organized pathway In the cat, whenever approximation of the ends of the nerve at operation had not been accurate, the amount of scar tissue which formed was much increased Even in a good scar there was considerable obstruction Silk excited less tissue reaction than any other material for suturing In man the only nerve grafting to be conducted with success was that of the facial nerve carried out after the method of Ballance

Professor Paterson Ross said that in five cases of median nerve injury and twelve of ulnar nerve injury in his ten years' experience the effects following secondary suture had not seemed so severe as Sherren's work had led him to expect There was, he thought, a tendency to attempt nerve repair in disadvantageous circumstances in early stages Mr Colyer asked whether the danger of late brachial plexus involvement was an indication for removal of the head of the bone in all cases Mr M F Nicholls agreed that these nerve repair operations should no longer be regarded as procedures which could safely be left to junior surgeons in a hospital Some failures were more due to the persons operating than to the actual conditions that arose The work called for great experience Mr Reginald Hosford asked whether, in median or ulnar nerve palsy of the hand, it was advisable to try to prevent contractions by means of firm splinting

The President (Professor Grey Turner) agreed that a number of delicate problems arose in connexion with nerve injuries sustained in fractures The point mentioned by Mr Nicholls was a very important one, some of these operations required as much skill and experience as did a gastrectomy Mr Platt in reply said that he did not think contracture could be prevented by splinting, he left his patients entirely unsplinted He thought instructions should be issued to most of the teaching hospitals on the lines mentioned by Mr Nicholls His reply to Mr Colyer was in the negative

ONCHOCERCIASIS AND BLINDNESS

The first Chadwick Lecture of the Royal Society of Tropical Medicine and Hygiene was held at Manson House on January 21, the president, Sir Arthur Shaw, being in the chair Professor Richard P Strong of Harvard University gave an address on onchocerciasis in Central America and Africa, illustrating his lecture by cinema films and lantern slides taken during his expeditions to those regions

In his introductory remarks Professor Strong pointed out that before 1932 there was nothing in the literature suggesting that ocular disturbances were connected with onchocercal nodules in African natives On the other hand, in Central America onchocerciasis was sometimes termed the "blinding filarial disease", hence the parasite which causes it was named *Onchocerca caecutiens* Robles in 1915 had found ocular disturbances and blindness in Guatemala to be associated with nodules situated in the region of the head and scalp After demonstrating microfilariae in lesions of the eyes in both Mexico and Guatemala, Hissette in 1932 drew attention to the frequency of onchocerciasis in the Belgian Congo and the high percentage of cases in which blindness resulted

This decided the lecturer to organize an expedition to Africa with the object of studying onchocerciasis along the lines which he had already followed in Central America Members of the expedition included an entomologist, a helminthologist a zoologist, and an oculist Headquarters were established in the village of Kassende in the Province of Lusambo in the Belgian Congo The inhabitants of the region were mainly Bantus of the Basonga tribe, but in some sections Baluba and Babingis were encountered Extensive infection of onchocerciasis was also observed among the forest pygmies A special study of the eyesight was made in 156 cases with ocular disturbances and the tissues of the eye were studied histologically in forty The association of ocular disturbances with this disease was demonstrated by the high percentage of failing vision and blindness in a locality where some 95 per cent of the population were infected with the onchocercal parasite and had demonstrable nodules Pruriginous and xerodermatous conditions of the skin were commoner than in Guatemala Experience in both Africa and Guatemala indicated that patients with nodules or tumours on the head or shoulders were more likely to develop ocular complications than those with tumours elsewhere Furthermore, microfilariae were discovered in greatest numbers in the skin in the vicinity of the tumours, very few were met with at a considerable distance from the tumours Bryant (1936) had recently made a study of Sudan blindness attributed to *Onchocerca volvulus* The ophthalmic appearances were those of a diffuse retinochoroiditis with optic atrophy, often associated with sclerosis of the retinal vessels and the deposition of masses of pigment on the retina The perivascular reaction so characteristic of onchocercal keratitis was not present D Hooghe (1935) had found that 2·1 per cent of 3,448 native Africans presented ocular complications but in most of them nodules were situated upon the trunk, the scalp being involved in only 5·7 per cent The mere presence of microfilariae in the bulbar conjunctiva in small numbers, however should not lead to the conclusion that the ocular disturbances were necessarily due to filarial infection In tropical countries heat, wind, dust, and smoke within the house or hut were all important in producing such disturbances Furthermore, avitaminosis, xerophthalmia, trypanosomiasis and arsenical poisoning might also be responsible for blindness in regions where onchocerciasis prevailed

Professor Strong emphasized that it was essential through oecological studies that a knowledge of the disease and its control had been advanced, and made an interesting comparison between conditions in Central America and those in Africa In both countries Simulium flies transmitted the disease In Guatemala and South Mexico onchocerciasis existed only on the southern slopes

on and the only indifferent onlookers are the boys and girls whose health interests as industrial units in the immediate future are at stake

Negotiations have, however, proceeded further than this comment appears to suggest. As reported in the *Supplement* of January 16 (p 29) a special conference of representatives of Local Medical and Panel Committees was held at British Medical Association House, London on January 7 for the purpose of considering the offer of the Minister of Health of a capitation fee of 7s 6d for medical attendance on insured workers under 16 years of age. The following resolutions passed unanimously by the conference, have been forwarded to the Ministry of Health and to every insurance practitioner

That the offer of the Minister of Health of a capitation fee of 7s 6d for medical attendance on insured workers under 16 years of age be rejected

That this conference recommends insurance practitioners to decline service for the provision of medical benefit for insured workers under 16 years of age at the terms offered by the Minister of Health

That, in view of the inadequacy of the existing capitation fee, and pending the result of negotiations for its increase this Conference is not prepared to accept for attendance on insured workers under 16 years of age a capitation fee less than that which is paid for adult workers

That the Insurance Acts Committee be authorized to take action in the light of the decisions reached by the Conference

Insurance practitioners will also be aware of the fact that the autumn Conference instructed the Insurance Acts Committee to go forward with the preparation of the case for a general increase in the capitation fee and it may be stated that the preparation of the case is now well forward. In the meantime the Ministry of Health has issued the following announcement

Statements have appeared in the Press relating to the capitation fee to be paid to panel doctors in respect of juveniles between the ages of 14 and 16 for whom the Government *desires to secure medical care under the national health insurance scheme.* It is the necessary practice of the Minister of Health before introducing a scheme of this kind to discuss the proposals with the interests concerned—including in this case the Insurance Acts Committee of the British Medical Association. Such a discussion is now taking place. Pending the conclusion of this discussion the Minister is obviously unable to make any statement on the matter and no importance should be attached to any unauthorized figures quoted

A Partner Who is Not a Deputy

It may be recalled that last summer the Middlesex Insurance Committee viewed a decision of the Minister on appeal with considerable concern and passed a resolution suggesting an amendment in the medical benefit regulations to secure that a practitioner who treats an insured patient of his partner *shall himself be responsible* for his acts and omissions. In the course of the report of the persons appointed to hear the appeal it was stated that

the question whether Dr. A was responsible for his partner's acts in this case presents difficulties. We think that having regard to the arrangements generally in force in doctors' partnerships it is legitimate to assume that a member of a partnership, in treating an insured patient of another member is acting as the latter's deputy. This is however we think a presumption which is capable of rebuttal. In the present case we feel bound to give Dr. A the benefit of the doubt and to accept the contention that he was *not* responsible for the acts of his partner. We should like to make it clear however that our conclusion is arrived at in the light of the peculiar circumstances existing in this case.

The representations of the Middlesex Insurance Committee were supported by the executive council of the National Association of Insurance Committees who submitted the matter to the Ministry of Health. A reply has been received from the Ministry stating that the representations of the executive council had been noted but pointing out that as the circumstances of the case were wholly exceptional the Minister was not satisfied as at present advised that the proposed amendment of the medical benefit regulations was either necessary or desirable or that it would not be calculated to create difficulties greater than that which it sought to remove.

Correspondence

PREGNANCY FOLLOWING CONFINEMENT

SIR,—Your commentator's suggestion (*Supplement* February 7 p 70) that it is misleading and improper to enter pregnancy as the incapacitating condition on a certificate covering incapacity after confinement is to say the least of it surprising. The actual certificate (Form Med 40) states "You have remained incapable *by reason of*." Does the writer of your weekly Insurance Medical Service notes seriously suggest the possibility of confinement and its consequences apart from pregnancy? That in effect, is what his expressed opinion amounts to.

Disability following pregnancy is just as much a part of the pregnancy as is post diphtheritic paralysis a part of the diphtheria.

In the case in question the principal of a practice was censured because of the perfectly proper act of his assistant. That is entirely foreign to the principles of British justice. It is most disconcerting to find the procedure meeting with the apparent approval of the *British Medical Journal*.—I am, etc.

Walsall, Feb. 6 FRANK G. LAYTON

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Commander R. A. Brown to the *Ganges*.

Surgeon Lieutenant Commanders W. R. S. Pankridge to the *Nelson*, L. J. Corbett to the P.R.T. School, Portsmouth.

Surgeon Lieutenants C. H. Egan to the *Pembroke* for Royal Marine Infirmary, Deal; D. D. Steele-Perkins to the *Acasta*; D. B. Jack to the *Anthony*; F. Bush to the *Victory* for Royal Naval Barracks.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant J. E. L. Morris to be Surgeon Lieutenant Commander.

ROYAL ARMY MEDICAL CORPS

Lieut.-Colonel and Brevet Colonel B. Biggar has relinquished the appointment of Assistant Professor of Military Surgery, Royal Army Medical College.

Lieut.-Colonel and Brevet Colonel C. M. Finny, *O.B.E.*, to be Assistant Professor of Military Surgery, Royal Army Medical College.

Lieut.-Colonel M. White, M.C., having attained the age for retirement has been placed on retired pay.

Lieut.-Colonel H. F. Panton, D.S.O., M.C., has retired on retired pay.

Majors W. Foot, M.C., and F. C. K. Austin to be Lieutenant-Colonels.

Lieutenants J. McN. Lockie and R. E. Waterston to be Captains.

ROYAL AIR FORCE MEDICAL SERVICE

Group Captain H. A. Hewat to Headquarters, Bomber Command, Uxbridge, for duty as Deputy Principal Medical Officer.

Group Captain T. Montgomery.

Flight Lieutenants P. J. McNally to R.A.F. Hospital, Cranwell; J. F. Dales to Central Medical Establishment, London.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Major G. P. A. Bracken, having attained the age limit of liability to recall, has ceased to belong to the Reserve of Officers.

tion—as, for instance, irresponsibility, aggressiveness, and suspicion, with such physiological data as blood-sugar ratio, basal metabolism, and blood pressure It was easy enough to smile at some of Lombroso's too facile correlations, but it was more correlations that were wanted, not merely between a specific misdemeanour and a particular anthropometric anomaly, but between character traits and functional deviations

Dr Crichton-Miller also touched on some genetics problems and argued that psychotherapists ought to be able to tell the community something significant about marriage "We psychotherapists stand, helpless and tongue-tied, while the optimistic parsons tie the knots at one end and the cynical old judges cut them at the other'

With regard to philosophy, he suggested that the usual training of a psychotherapist was unduly scientific, with not enough philosophy in it It would "shake the otherwise enviable infallibility of the minor prophets of the Freudian hierarchy if they were to be put through a modified course of philosophy study They might revise the Freudian version of evolution" As for religion, he argued that it was a complete misrepresentation to suppose that the frontier line between religion and psychology was the same as that between the physical sciences and religion The physical sciences had nothing to do with valuation After discussing Freud's attitude to religion, Dr Crichton-Miller earnestly contended that religion could not be shut out of psychotherapy Some of those who came to them were in jeopardy because they were at the mercy of overwhelming instinctive forces, others because the limited logic of facts destroyed their self-confidence and veiled their vision Taking up the aphorism of a witty Frenchman that "mankind will always prefer the false to the vague," Dr Crichton-Miller bade psychotherapists beware lest when their patients came to them seeking something different from the vague they did not offer them the false instead It was because he felt this so strongly that he rejoiced that Dr T A Ross in his recent presidential address to the Psychiatry Section of the Royal Society of Medicine—a particularly opportune deliverance—ended it with the words "Where there is no vision the people perish"

ASSOCIATION OF CLINICAL PATHOLOGISTS

ANNUAL MEETING

The tenth annual meeting of the Association of Clinical Pathologists was held at the British Post-Graduate Medical School on January 30 The new president of the society, Dr S C DYKE, referred to the great loss sustained by the death of Professor E H Kettle It was by his invitation that the meetings were being held at the Post-Graduate School, and it had been expected that he would preside Professor Kettle's place as chairman of the meeting was taken by Dr JANET VAUGHAN

Laboratory Diagnosis of Gonorrhoea

The first half of the morning session was devoted to a discussion on the laboratory diagnosis of gonorrhoea

Dr GOODHART in a communication on the diagnosis of gonococcal infection by films, said that there had been no important alteration in technique during the last twenty-five years most people now used some modification of the original Gram method for staining, but for the particular purpose under consideration there was still a good deal to be said for the older technique as it avoided the danger of over-decolouring with alcohol He had never departed from the admirable practice, insisted upon in his early days by Professor Eyre of reporting only what he found and never saying that gonococci were present when from the nature of the investigation a definite bacteriological diagnosis was manifestly impossible Several workers had published figures to show the comparative value of smears and cultures in diagnosis Conclusions differed, but they all seemed to confirm the view he had reached as the result of practical experience namely, that everything depended on the material one was working with Most of the statistics came from workers in venereal disease clinics or from research departments In the former there was a reasonable presumption that the material sent for examination came from a patient who had been exposed to the chance of gonococcal infection, and in the latter optimal conditions for successful culture could be arranged Much of the work of the ordinary practising clinical pathologist had to be done under very different conditions

Dr Goodhart's own views had undergone a complete change since he had been working in the hospitals of the London County Council, and he now regarded Gram-negative cocci other than gonococci to be such frequent inhabitants of the urogenital tract as to make the diagnosis by film alone highly dangerous, especially in vulvovaginitis in children Most workers who had investigated cultural results carefully had found a number of 'pseudo gonococci," and the main purpose of his communication was to illustrate this point He then described ten cases from which he had isolated Gram negative cocci that from their cultural characteristics were clearly not gonococci according to prevailing views In some of these cases smears had shown typical Gram negative intracellular diplococci, in others not even pus cells were present His experience suggested that it was often difficult to make an accurate diagnosis of gonococcal infection even by culture and that it was practically impossible by film alone

Culture Methods

He was followed by Dr JOHN OLIVER, who spoke on the diagnosis of gonorrhoea by culture Two types of transparent culture media for the growth of gonococci were described Hydrocele agar was considered ideal where it could be prepared without undue difficulty or in substitution the egg-albumin medium of Price, which gave almost equally good results and was usually less difficult to prepare The need for immediate inoculation of exudates was stressed and the desirability of incubation at temperatures lying between 35 5° C and 36 5° C without undue delay was also pointed out The question of moisture in the culture tubes was dealt with and desiccation described as the most important factor in the death of gonococci in swabs

The influence of the atmosphere in which culture takes place was considered and it was pointed out that a replacement of some 8 or 10 per cent of atmospheric by CO_2 gave some distinct advantage for successful culture of gonococci The oxidase reaction as a means of diagnosing the presence of gonococci in mixed cultures was explained, and finally the fermentation reactions of the organism were discussed very briefly

The discussion or diagnosis of gonorrhoea by the complement-fixation test was to have been opened by Dr ORPWOOD PRICE but owing to his absence on account of illness this subject was introduced by Dr C DUKES who gave a brief account of Price's method of performing the test and discussed the general significance of the reaction

Complement-fixation Test

Dr Dukes said that it was important to bear in mind in the first place that this serum reaction did not show the presence or absence of gonococci in the tissues, it only registered the presence or absence of gonococcal antibodies in the blood The amount of such antibodies might be expected to vary with the amount of toxin absorbed It was obvious that if the gonococcal lesion was "open," with plenty of opportunity for free drainage there would be comparatively little opportunity for toxin absorption This state of affairs existed in simple gonococcal urethritis, and explained why the complement-fixation test remained negative for the first week or two of the disease If the disease spread to the seminal vesicles the toxic products were unable to drain efficiently

METROPOLITAN COUNTIES BRANCH HENDON DIVISION—Tuesday February 16 Lecture by Dr H Letheby Tidy

METROPOLITAN COUNTIES BRANCH ST PANCRAS DIVISION—At B.M.A. House Tavistock Square W.C. Tuesday February 16 9 p.m. Dr Kenneth Tallerman Problems Associated with the *Newly Born Infant*

METROPOLITAN COUNTIES BRANCH WILLESDEN DIVISION—At Willesden General Hospital Wednesday February 17 9 p.m. Film *and demonstration of cellona bandages in treatment of fractures*

NORTH OF ENGLAND BRANCH DURHAM DIVISION—At Durham County Hospital Tuesday February 16 8.15 p.m. business meeting 8.45 p.m. Dr E. F. D. Dawson Walker (Newcastle upon Tyne) Recent Advances in Infectious Diseases

NORTH OF ENGLAND BRANCH GATESHEAD DIVISION—At Liberal Club Pilgrim Street Newcastle upon Tyne Tuesday February 16 8.15 p.m. Address by Professor E Farquhar Murray (Newcastle upon Tyne) Supper at 8.45 p.m.

NORTH OF ENGLAND BRANCH NORTH NORTHUMBERLAND DIVISION—*At Blue Bell Hotel Belford, Wednesday February 17 3 p.m.* Dr Mason Bolam (Newcastle upon Tyne) Common Skin Diseases and their Treatment

NORTHERN IRELAND BRANCH NORTH EAST ULSTER DIVISION—*At British Legion Hall Maghernfelt Friday February 19* 4 p.m. Professor R J Johnstone Maternity Services in Northern Ireland (Meeting postponed from January 29)

SOUTH WESTERN BRANCH PLYMOUTH DIVISION—*At Goodbody's* Café Bedford Street Plymouth Wednesday February 17 8.30 p.m. Discussion Is Ante-natal Care Worth While? To be opened by Mr James Riddell Preceded by supper at 7.30 p.m.

STAFFORDSHIRE BRANCH WALSALL AND LICHFIELD DIVISION—At Manor Hospital Tuesday February 16 8.0 p.m. Mr B T Rose Clinical demonstration

SURREY BRANCH KINGSTON ON THAMES DIVISION—At Public Assistance Department Norbiton Friday February 12 8.30 p.m. Colonel G Wallace Air Raid Precautions and Antigas Treatment

SURREY BRANCH RICHMOND DIVISION—Friday February 12 9 p.m. Paper by Mr B Whitchurch Howell

SUSSEX BRANCH BRIGHTON DIVISION—At Sussex Eye Hospital Eastern Road Brighton Thursday February 18 3.45 p.m. Clinical meeting

YORKSHIRE BRANCH BRADFORD DIVISION—Wednesday February 17 B.M.A. Lecture by Professor L J Witts Hemitemesis and Melaena

YORKSHIRE BRANCH SHEFFIELD DIVISION—At South Yorkshire Mental Hospital Wadsley Tuesday February 16 8.30 p.m. Demonstration of clinical cases Paper by Dr A Pool The Mental Treatment Act 1930 Voluntary and Temporary Patients

Meetings of Branches and Divisions

GLASGOW AND WEST OF SCOTLAND BRANCH DUMBARTONSHIRE DIVISION

The annual dinner of the Dumbartonshire Division was held at Glasgow on January 13 when Dr A G R INGRAM presided over a representative gathering of members The guests of the evening were Dr R W Craig (Scottish Medical Secretary) and Dr J G McCutcheon (president of the Glasgow and West of Scotland Branch) Dr W SCOTT proposed the toast of The British Medical Association to which Dr CRAIG replied Dr T MILLER proposed The Guests and Dr MCCUTCHEON replied The CHAIRMAN presented Dr E Neil Reid who has been appointed as medical officer of health for Stirlingshire with a cheque subscribed by members of the Division in appreciation of his co-operation during his years of service as deputy county medical officer

LANCASHIRE AND CHESHIRE BRANCH

Lecture on Psychotherapy

At a meeting of the Lancashire and Cheshire Branch held at Manchester Royal Infirmary on January 14 under the chairmanship of Dr E BOSDIN LEECH Dr H CRICHTON MILLER delivered a British Medical Association Lecture on Psychotherapy

The lecturer pointed out that the subject of the lecture had been chosen for him and that he was not responsible for its very general character also that the subject was not in any way co-extensive with the treatment of functional nervous disorder which might call for methods other than psychotherapy Dr Crichton Miller said that whereas a generation ago *the practitioner's attitude to rheumatism* was *If my salicylates don't cure the patient he must go to a spa* to-day there was a serious attempt to differentiate aetiological factor Similarly the attitude of the practitioner to functional nervous *disorders might be formulated thus If bromide and valerian* don't cure the patient I'll have to send him for a cruise In point of fact the most important thing to bear in mind about functional nervous disorder was the probability of a multiple aetiology it was in relation to this that the correct place of psychotherapy became obvious As an example the lecturer gave the *familiar case of the 40 year old man who fails to* recover from a simple attack of influenza The depression lassitude and irritability are put down to post-influenzal neurasthenia Later the services of a psychotherapist may be sought But the condition is actually what Freud would describe as an anxiety neurasthenia The essence of such a case might be the fact that the influenza virus had affected an adrenal system already exhausted by years of marital maladjustment—namely the practice of coitus interruptus

Doctors were wont to claim that every good general practitioner was a psychotherapist Some went on to suggest that any other form of psychotherapy was fantastic nonsense The lecturer pointed out that there was a sense in which this claim was true The essence of psychotherapy was necessarily present in every successful practitioner *His method* was reassurance and by that method he influenced bodily functions to a remarkable degree But psychotherapy as understood to-day and *in the hands of* an expert necessarily meant more than reassurance Therefore it was desirable *to have* some knowledge of the part played by the specialist and that which should be played by the family physician

The first matter for investigation was heredity and here the careful practitioner could prepare information which would certainly save time at the consultation and perhaps make that consultation unnecessary The psychotherapist could next pass to the question of temperament and in this connexion the lecturer pointed out the special difficulties associated with *the psychasthenic obsessional* and cyclothymic types The next point to be considered would be the pattern of childhood

five years the first three of which felt the full force of the widespread financial difficulties subscriptions and donations maintained a steady level at between £952,000 and £987,000 a level of nearly £200,000 above the receipts from this source in 1921. In this period, moreover receipts from patients showed a continuous increase the total in 1935 being £275,000 over that in 1930. The number of pay-beds rose by approximately 1,000 between 1921 and 1930 and have since increased by about 600 to a total of nearly 2,000 in 1935. The increase in total ordinary income in the fifteen years has been about £1,200,000 or nearly 48 per cent. There is no evidence of any falling off in legacies the annual average for the five-year period mentioned being fully £450,000 while a figure of £500,000 was reached twice in this period. The increase since 1921 in the total general fund income has been approximately £1,450,000 or fully 52 per cent. Expenditure in the years under review grew greater owing to the expansion of work and details are given in the report of the various causes for this including the necessary provision of larger staffs and other lines of expansion. In 1921 the number of beds was 13,300 and since then it has steadily risen until in 1935 there were 18,020. The number of new in-patients rose from 172,200 to 274,100 in 1935 of new out-patients from 1,545,000 to 1,872,000 and of total out-patient attendances from 6,661,000 to 9,777,000 even though efforts have been made in recent years to discourage the attendance of patients suffering from minor disabilities. The number of new out-patients seems to be nearing its maximum for the greater portion of this increase occurred in the first ten years of the period under review the rise since 1930 being only 52,000. The number of out-patient attendances is still rising due to the development of out-patient departments on consultative lines and to the provision of specialized long-term treatments. There has been an aggregate credit balance in all except two years in respect of current finances but capital expenditure is increasing owing to rebuilding extensions and major improvements in equipment. It is here that the margin is inadequate, and continued and generous support is still urgently needed. There has been an astonishing growth in the voluntary payments by patients direct to the hospitals and through patients' societies. The Hospital Saving Association founded in 1922 with the backing of the King's Fund has now a membership of over 1,600,000 throughout the country. So important have the voluntary payments by patients now become that they approach in amount the income derived from gifts of the charitable public, which was £1,836,000 in 1935. It is plain therefore that the voluntary hospitals are not dying out for lack of funds. In 1935 the total maintenance income of 145 London hospitals amounted to £7,190,000 the highest figure yet recorded compared with £3,980,000 in 1934. In that year the total maintenance receipts from voluntary sources formed 43·8 per cent of the total general fund income, and covered 45·2 per cent of the expenditure. The repeated deficits reported by particular hospitals are not typical of the general tendency of hospital finances down to the end of 1935 but are due to more or less exceptional circumstances—for example the necessity of improving building and equipment and of providing for the increased upkeep thus involved.

L.C.C. Consultant and Specialist Service

The Hospitals and Medical Services Committee proposes that the arrangements for a consultant and specialist service under the London County Council which come to an end on March 31 shall be continued for a further year with certain modifications and additions. The number of routine sessions to be worked by consultants and specialists at grouped general hospitals has been limited to a total of 222 a week. Consequent upon the employment of two full-time radiologists at two selected groups of hospitals twenty-two sessions a week at present worked by part-time radiologists can be given up. A new authorized unit of 20 sessions a week is provided. The salaries of all consultants and specialists under the group scheme are at the rate of £125 a year for one session a week and £75 a year for each additional session. It is found that the need for regular visits by consultant radiologists does not obtain in the same way as for other specialties and it is proposed to call them in as required and pay them on a visit basis. They will receive remuneration at the rate of two and a half guineas a visit on the understanding that during any year the payments made shall not exceed £125 for the first session and visits £200 in respect of 104 visits and £75 for the second session. It is also proposed to increase the existing private salary for three sessions a week—as the consultant's remuneration. It is also proposed to increase the existing authority for the services of thoracic surgeons to 2½ sessions a year (from 160) for the tuberculosis hospitals and to 170 sessions (from 120) for the general hospitals. A new position of consulting thoracic surgeon is to be added to the establishment of St. Mary Abbots Hospital and some financial recognition, in the nature of an honorarium is to be made of the services of the consultant attached to the cardiovascular unit at London Hospital. Three of the six honorary consultants at St. Stephen's Hospital for research into selected cases of vascular diseases are to receive remuneration on the same basis. It is also proposed that the services of neurological surgeons are likely to be more frequently required in the future, and the time is approaching when consideration will have to be given to that question, but for the present the existing arrangement is to continue. The financial effect of the various proposals will be an additional expenditure of £6,125.

SCOTLAND

Sir Charles Hastings Lecture

The Sir Charles Hastings Lecture, under the auspices of the British Medical Association, will be delivered by Professor E. P. Cathcart, C.B.E., LL.D., M.D., D.Sc., F.R.S., Regius Professor of Physiology in the University of Glasgow, in the McLellan Galleries, 270 Sauchiehall Street, Glasgow, on Tuesday, February 23, at 8 P.M. The subject is "Food and Nutrition." The Secretary of State for Scotland will preside. Across on will be obtainable from the honorary secretary of the Glasgow Division, B.M.A., 257 West George Street, Glasgow.

Glasgow Western Infirmary

At the annual meeting of subscribers to the Western Infirmary of Glasgow held on February 5 Lord Provost John Stewart, who presided, made a statement regarding the attitude adopted by the municipal authorities of Glasgow towards the voluntary hospitals in the city. He said that if the voluntary system was not able to provide adequate accommodation for those requiring treatment, it would be the duty of the State or of the municipality to provide the necessary facilities. The committee appointed a committee to make an investigation to define information regarding the extent to which although it had no intention of asking other hospitals. Commenting on the report of the Western Infirmary showed that the income for last year had been £92,281 leaving a deficit of £2,000. The expenditure had been an increase in income, including employees' subscriptions amounting to £1,000, and he suggested that an intensive campaign should be undertaken to collect more money from the general public. Sir Thomas Roxburgh, chairman of the managers, said that they had been obliged to draw £8,000 from capital account. The extraordinary expenditure was due to heavy and unfortunately it was likely that they would again be heavy during the current year. The managers appeal for special contributions.

JEWISH MATERNITY HOSPITAL Underwood Street E—Two Assistant Anæsthetists

both as to climatic and food factors, I thought it might be of interest to relate my findings and the reasons for reaching them

In Brisbane Australia, between the years 1926 and 1934, some six thousand children ranging up to 12 years in age had both antra aspirated into a 10 c cm syringe just before adenectomy or tonsillectomy, or both When pus was found to be present in one or both antra the children were reviewed six weeks after the operation I have one set of figures comprising five consecutive years work showing that at this review 62 per cent of children so inspected were considered on clinical grounds to have healthy sinuses Of these some 7 per cent subsequently showed signs of sinus involvement, so that in any case close on 60 per cent appeared to have completely recovered These children live in a subtropical zone, where there is abundance of sunshine throughout the year where overcrowding is a negligible factor, and under social conditions in which though there is a high cane sugar intake, there is also a high consumption index for fresh meat, eggs butter, green vegetables, fruit, and warm milk One peculiarity of the Brisbane population (from which these children were drawn) is the abnormally high apparent incidence of sinus infection as compared with figures published for populations living in Europe and North America As far as I am aware no survey has ever been made on the matter in any part of Australia

Last year, at the New York Academy of Medicine post-graduate course in diseases of the respiratory tract Dr Porter, the instructor in otology at the Harvard Medical School, expressed himself in regard to sinusitis in children in terms which fairly accurately represent my own conclusions He said

"The nasal mucosa in children, although the seat of chronic infection, shows much greater recuperative powers when proper drainage is established than is the case with adults In obtaining a cure frequently all that is necessary is to remove the infected tonsils and adenoids and then follow this with occasional treatments of shrinkage and treatment of the nasal mucosa For some time thereafter it is necessary to have the patient report for treatment during an acute nasal infection *Occasionally* it is necessary to resort to radical measures in children to the extent of exenteration of the ethmoid and some form of radical antrum operation These proceedings are well tolerated and often produce truly surprising results Sometimes it is advisable to do a partial submucous resection of the septum even in children"

Latterly I have come to suspect that tonsillectomy and adenectomy will give place to more scientific dietetic adjustments in the relief and prevention of these conditions at present it seems that the same measures applied in different communities in the world produce widely divergent results (Dr Porter's word "occasionally" gives a decidedly optimistic note), and that to me suggests the likelihood that the biochemist will eventually prove of greater value than the surgeon in cases of sinusitis in children—I am, etc,

Luton Feb 2 J A R MURPHY, F R A C S

School Medicine

SIR—With reference to school medicine, I should be grateful to any British colleagues who would kindly let me have their opinion and experience on the subject of the practical organization of school medical inspection, especially as regards (1) its importance in preventive medicine and (2) the organization of physical education As I have to present a report on this subject to the Societe Medicale Belge de Physiothérapie any information would be welcomed—I am, etc,

Cancer of the Breast

SIR,—Mr Sampson Handley complains that in my letter (*Journal* January 30, p 242) I have made indefensible claims for the hospital which he is good enough to say that I 'adorn" My remark was that "radium technique began to be developed at St Bartholomew s Hospital about twelve years ago" This is merely a statement of fact, and I should not have thought it was capable of the construction that Mr Handley chooses to put upon it Radium treatment had not been used at my hospital before that time, and nothing more is stated or implied in the words used In the rest of the sentence as printed I am made to say "its value and limitations in cancer of the breast *began* to be fairly clear" What I wrote was "*begin* to be fairly clear," and possibly some slight ambiguity may have been introduced by this mistake in the typescript I am well aware that Mr Handley had used radium before this, though in an entirely different way, and I hope he will be content with this explanation, as I regard all discussions on priority as being valueless

Having started with a misunderstanding, Mr Handley then attributes to me a view I have never maintained—namely, that "radium alone" is to be the chosen form of treatment My only object has been to ascertain exactly what might be the value and limitations of radium —I am, etc,

London, W 1, Feb 8 GEOFFREY KEYNES

SIR,—Knowledge and practical experience of the three methods of treatment of breast cancer (operation, x rays, and radium) can hardly be possessed in equal measure by any one medical man, so a symposium, as the discussion in your columns following the valuable paper by Mr Cecil Rowntree seems to be developing into, is the only way in which a wide and undistorted view can be obtained of the best methods in current practice

My own experience, based on about two hundred new breast cases seen yearly, leads me to offer the following suggestions

1 For all operable, borderline, or inoperable (surgically or medically) cases a first trial of the response to a well planned and executed course of x rays to the primary and the whole of the lymph drainage areas

2 In six weeks to three months after the end of the x ray course all signs of the disease may have disappeared, or only a small residue be left of the primary, if so, wait a further period, with monthly or less frequent examinations* If the response is inadequate to a full x ray course more x rays (perhaps by another method—for example, lower intensity and longer time), interstitial radium, or local or radical mastectomy should be considered (possibly followed with further x ray treatment at longer intervals, as after primary operation cases)

3 For cases of local recurrence after operation deep x rays should similarly be tried in the first instance (a number of statistical reports show five-year freedom from signs in inoperable cases of from 20 to 36 per cent), or low voltage "contact" x-ray therapy for small isolated and superficial nodules If the response is incomplete interstitial radium may then be tried, or operative removal be attempted and followed by *x* rays or surface radium

4 For all metastatic cases—in the bones, chest, abdomen, or elsewhere—as deep x rays occasionally prove successful they should be tried and persevered with the metastases may be more radiosensitive than the primary was and even the signs of metastatic hemiplegia have been relieved (as in a case I once saw treated) Treatment may be either local (or local to the worst sites) or generalized (as by teleroentgen therapy methods) Much alleviation of symptoms is possible in a large proportion of metastatic cases and medicinal means may be found a useful adjuvant (as Maisin s 'barcan)

* For review of results see Hutchison, E G (1936), *Surg Gynec Obstet* 62 653

(*b*) A standardized articulation test of the patient's capacity to respond to amplified speech under controlled conditions

(*c*) Articulation tests with the instrument which it is proposed to supply the patient for a period of trial

(*d*) Familiarity on the part of those responsible for the supply of aids with the physical characteristics of each type of instrument especially its frequency response and effective amplification

To these might be added a clinical examination by an otologist

Seven excellent tables are given which bear witness to the vast amount of careful work which is the subject of this investigation and the results are a valuable contribution to knowledge

KITCHENER SCHOOL OF MEDICINE, KHARTUM

The fifth report of the Kitchener School of Medicine Khartum *covers the period 1933-5 and includes the reports* of the assessors for these years who were respectively Professor A K Henry and Dr H L Tidy, Professor H B Day and Mr Hugh Lett and Sir Walter Langdon Brown and Mr C H Fagge It is announced that the previous curriculum of four years followed by a compulsory year of post graduate training in resident appointments has now been replaced by a course lasting five years Comment is made that the students knowledge of facts is very good but that there is weakness in their ability to argue from them and to make the deduction which is a most essential part of the training of a medical practitioner The proposed change in the curriculum would probably be of benefit in this connexion, especially if associated with the selection of students of the most promising type and the early weeding out of those who appear unsuitable Entrants to the School of Medicine are selected from the fourth year students of the scientific section of the Gordon College

A graphic museum is being built and equipped at an approximate cost of £3 200 it will contain sections dealing with all diseases and particularly with public health and quarantine problems of the Sudan A pathological laboratory to accommodate ten students has been erected and various *pathological specimens have been sent to the museum from* London The number of hospital beds available for teaching purposes has increased from 270 in 1930 to 560 in 1935 and separate departments of ophthalmology, obstetrics and gynaecology have been organized in addition to those already existing for medicine and surgery All obstetrical work has been centralized under the Government obstetrical surgeon comprising the midwives training school midwifery conducted in the district and the Omdurman hospital for women labour cases being carefully apportioned between medical students and midwife pupils It is hoped that this scheme will go a long way towards solving the difficulty always present in a Moslem country of obtaining enough practical experience in midwifery for medical students The first post graduate course will probably be held in 1939 and the organization of this will be the only new development during the next few years

Selected Sudanese medical officers are to be promoted to the rank of Sudanese medical inspector to undertake the duties of the present British medical inspectors The cadre of British medical practitioners is only forty three and it will not be advisable in the public interest to reduce the number appreciably for many years to come, but it is expected that new posts created by future developments will be filled by suitable Sudanese officials Three Sudanese sanitary officers have qualified and are successfully holding posts previously filled by British sanitary inspectors enabling the services of these latter to be used to greater advantage elsewhere adequate direct supervision of the sanitary service now being established even in the more distant parts of the country Sixty six graduates of the Kitchener School will have replaced the entire cadre of Syrian medical officers by 1938 and the future output will be sufficient to replace wastage relieve medical officers on post graduate courses and cater for future expansion

Reports of Societies

ANAESTHETICS FOR NOSE AND THROAT OPERATIONS

A combined meeting of the Sections of Laryngology and *Anaesthetics of the Royal Society of Medicine* was held on February 5 with Mr LIONEL COLLEDGE, president of the Laryngology Section in the chair for a discussion on the choice and technique of anaesthetics for nose and throat operations

Mr T B LAYTON said that there were three methods of approach to the subject that all operations should be performed under a general anaesthetic unless there was something to prevent it that all operations should be performed under a local anaesthetic, with a similar proviso and an intermediate position To the general principles of surgery there had to be added for operations in this area the principle of a guarded larynx In bronchoscopic work the difficulty of maintaining a general anaesthetic in and out of the defile of the larynx made local *anaesthesia the method of choice He had seen major* operations on the neck performed excellently under either general or local anaesthesia but his own feeling was that, with the possible exception of block dissection of the glands of the neck, the future of surgery in this field if it had a future lay in local anaesthesia With regard to premedication with local anaesthesia morphine preferably combined with scopolamine was the best agent It had the advantage that the patient could be roused by a firm voice and when roused retained control It was also an antidote to cocaine, and therefore, if anything a factor of safety rather than of danger With general anaesthesia the increased risk of premedication had to be weighed against any advantages that might be claimed for it So far as he could see morphine offered the least risk and it had the further advantage that it brought the patient into the operating theatre in a comfortable sleepy condition rather than the deep stertorous state produced by other drugs After morphine it seemed to him that avertin was the least risky and the barbiturates the most But the chief problem was why premedication was needed at all under local anaesthesia It was needed to neutralize the unpleasantness of the manual manipulations during the *performance of the operation With general anaesthesia it* was used merely to bring the patient into the theatre—that is, to neutralize fear

Fear arose at two stages in operative surgery—namely when the patient first decided to face operation and again during the short period while unconsciousness was supervening It was the surgeon's business to neutralize or prevent the latter fear arising It was a criticism of the technique that it should be necessary to neutralize with a potent drug a fear that should never have been allowed to arise A mental as well as an operative technique was necessary and this should include the whole period from the time when the patient consented to operation to the time when he was made unconscious It was due to nothing but suggestion if the fear became greater when unconsciousness resulted from something given by the mouth rather than by rectum The aim should be to induce the patient to look upon the operating theatre as a place where he could find relief from pain discomfort or disease rather than as a chamber of horrors If such a mental technique were available premedication would be unnecessary with general anaesthesia

Basal Anaesthesia

Mr H E G BOYLE said that there were as many ways of anaesthetizing throat cases as there were surgeons and anaesthetists He described the technique which he had evolved for himself after thirty-four years continuous work in the throat department of St Bartholomew's Hospital The advent of basal anaesthesia had been of enormous advantage especially in throat cases The basal

airtight as possible, and the apparatus is attached to an air inlet by the window In a short time the room is filled with a pleasant-smelling and non-irritant vapour Infection in the respiratory tract is unquestionably reduced in nearly every case, with the consequent disappearance of symptoms I have seen cases of chronic widespread sinusitis, confirmed by a lipiodol x-ray photograph, improve immeasurably, as shown by a further x-ray film Many chronic bronchitics and asthmatics have responded in a remarkable manner At the same time I have not seen any ill effects even after a prolonged inhalation of this vapour I venture, therefore, to hope that this particular form of treatment will receive some recognition in the near future—I am, etc,

London W 1, Feb 3 J RAYMOND THORNTON

*** In the leading article referred to by Dr Thornton we stated "It seems premature, however, to decide that the results obtained with the Duke-Fingard treatment 'appear to be permanent' or that the treatment is in any sense a cure The history of asthma and tuberculosis is a long record of premature publication and over-optimism, and it is a pity that a treatment of this kind could not have been submitted for trial to the Asthma Research Council or the Therapeutic Trials Committee of the Medical Research Council, with precise details of the formula, before an appeal was made for public subscriptions"—ED *B M J*

"Rachi-resistance" and Spinal Anaesthesia

SIR—I doubt whether the interesting article by Dr W R Black and Mr G A B Walters (*Journal* January 30, p 218) will convince anaesthetists of the existence of "rachi-resistance" The rare failures of spinal anaesthesia can usually be explained by anatomical peculiarities or errors in technique An example of the latter which is sometimes unrecognized is the sterilization of the syringes and needles in boiling tap-water In certain districts the alkalinity is sufficient to render the anaesthetic solution inactive This applies especially to the hypobaric percaine technique—I am, etc,

London N W 8 Feb 5 C LANGTON HEWER

Estimation of Coagulation Time

SIR—The paper by H Trought and J W Riddoch (*Journal* December 12, 1936, p 1194) on a simplified method of estimating the coagulation time of the blood prompts me to describe a method which I have been using for thirty years I was taught Wright's technique in Sir Almroth's laboratory in 1907, the method to be described is based on the original technique

Glass tubing is drawn out into a capillary (not too fine) at one end the other end carries the usual teat The tip of the patient's finger is pricked so as to assure a good flow of blood and blood is drawn up by means of the teat till the capillary is nearly filled The capillary is then taken from the drop and the blood drawn up by means of the teat, to an inch or more from the end The end is sealed off in gas or spirit flame or plugged with wax (or soap even) The time is noted and the tube and teat placed in the incubator at 37° C or immersed in a jug of water at approximately that temperature After five minutes the tube is taken from the incubator and the teat removed, then a scratch is made with a file about an inch above the end of the blood column Break the end off if a thread of fibrin does not stretch out between the two ends coagulation has not yet taken place Continue the scratch and break process every half-minute The first appearance of the thread gives the coagulation time Any time below six minutes can be taken as normal

It is well to fill two capillary tubes at about one minute's interval, using the second as a control Most of my work has been done in connexion with the removal of tonsils I have not had a single complaint——I am, etc,

Injection Treatment of Hernia

SIR,—The letter on injection treatment of hernia by Mr E W Archer in the *Journal* of January 30 (p 246) has prompted me to write and confirm what he has to remark on this question I have recently carried out some experimental work on this subject at the Buckston Browne

FIG 1—Section of the injected area after one week The muscles are being infiltrated with cells

FIG 2—Section of the injected area after the third week The muscular tissue is almost replaced by cellular infiltration which is going on to fibrous tissue formation

Experimental Laboratory, through the courtesy of Dr John Beattie of the Royal College of Surgeons of England

White rats were used, and were injected in the lumbo dorsal region with a sclerosing fluid (quinine urethane and lithocaine) The rats were killed at weekly intervals and the area injected was cut out and examined microscopically after the usual preparations Two of these slides are shown, and it will be seen that there is much more consolidation of the fibrous tissue in Fig 2 than in Fig 1 thus showing that the injected solution leads to a definite fibroblastic reaction The same change occurs in the hernial canal when the same solution is injected into it

Mr Archer quotes a case where the hernia was cured by five injections He is very fortunate to have had such

INJURIES OF PERIPHERAL NERVES

At a meeting of the Section of Surgery of the Royal Society of Medicine on February 3 Professor G GREY TURNER presiding the subject for discussion was injuries of the peripheral nerves

Mr HARRY PLATT in introducing the subject said that twenty years had elapsed since the great war was responsible for such a heyday of peripheral nerve surgery, and there had now arisen a generation of surgeons who had no share in that unique experience In February 1920 he explored forty one injured nerve trunks and presented at the Royal College of Surgeons an analysis of pathological findings in 510 peripheral nerve operations over six and a half years In the past six years he had done no more than eighty nine such operations in civil practice the nerves involved being ulnar fifty five, median, fifteen, brachial plexus nine external popliteal five, musculospiral four and anterior tibial, one In thirty nine cases the nerve injuries complicated fractures and dislocations in thirty-two they were due to penetrating wounds in nine there were traction injuries of the brachial plexus and in nine there were other causes Many nerve injuries in civil life especially lesions associated with fractures, and most of the traction lesions of the brachial plexus in both infant and adult did-not reach the operating theatre

The nerve lesions of civil practice were due to a variety of causes, and therefore presented a widely varying clinical problem With regard to nerve lesions accompanying fractures and dislocations in simple fractures peripheral nerve complications were uncommon Not infrequently the signs of nerve involvement became fully established only during the early weeks following the injury and in these circumstances the methods of treating the fracture which had been carried out might be open to criticism In dislocations and fracture dislocations of the shoulder-joint except for circumflex palsy nerve complications were rare Circumflex palsy was seen in about 5 per cent of all subcoracoid dislocations reduced promptly and efficiently in a large casualty clinic The nerve lesion here was a traction injury produced at the time of the dislocation In most cases with circumflex lesions relaxation and re education brought recovery in three to four months In infraclavicular plexus trunk involvement he had found that the nerve lesions almost invariably dated from the moment of the joint injury and that when the nerve trunks had escaped initial damage the continued presence of the dislocated head in the axilla did not necessarily or even commonly set up a compression neuritis The full effects of a severe infraplexus lesion were rarely demonstrable during the first week On the whole the prognosis in primary lesions of the infraclavicular plexus trunks was not unfavourable, complete recovery within three to six months was the rule in posterior cord lesions For inner cord lesions the recovery time was much longer

Secondary Lesions

In the case of the true secondary lesions associated with an unreduced dislocation spontaneous recovery always tended to be inhibited because of the strangling effects of the extensive scar tissue which formed round the dislocated head The nerve trunks should be freed without delay either by means of open reduction or by excising the head of the humerus

Musculo spiral palsy could be seen either as a primary or as a secondary lesion Primary lesions usually resulted from the direct impact of a bony fragment and it could follow over zealous efforts to manipulate the fractured portions into exact alignment Secondary lesions here were due to adherence of the nerve trunk to a projecting fragment or irregular bony surface In such surroundings the nerve trunk became gradually obliterated by dense cicatricial tissue Most musculo spiral lesions accompanying simple fractures were able to show spontaneous recovery, hence it was sound practice to employ conservative measures

Nerve Injuries at the Elbow

Dealing next with nerve lesions in fractures and dislocations of the elbow Mr Platt said that the incidence of nerve complications in fractures of the elbow was very low In this group the nerve lesions were almost exclusively in fractures of the lower end of the humerus or subluxation of the elbow joint The special vulnerability of the ulnar nerve in the post condylar groove was well recognized The lesions were usually incomplete and under correct treatment the recovery was spontaneous But in some there was a severe progressive neuritis and for this a special neurolysis operation was needed involving transposition of the nerve to the front of the elbow

In twenty two examples of epicondylar inclusion the ulnar nerve showed evidence of primary damage—that is in all the cases In seventeen of them the injured nerve was explored and transposed Secondary lesions became evident three or four weeks after the date of injury and could be seen in both internal epicondylar and supracondylar fractures The underlying cause was a disturbance of the normal relation between the nerve trunk and its bed Owing to its more protected situation the median nerve was but rarely implicated in elbow joint fractures but the nerve trunk was occasionally impaled on the projecting lower end of the shaft in a supracondylar fracture with gross backward displacement of the lower fragment

Turning to the lower limb he said that in extensive ruptures of the ligamentous structures on the lateral aspect of the knee produced by powerful adduction of the leg on the thigh the external popliteal nerve might sustain most serious damage In five of his cases a complete anatomical lesion with an extensive gap was discovered and under great difficulty the operation of end to end suture was carried out Often in such cases it was very difficult to find the distal end of the nerve trunk

With regard to nerve injuries due to penetrating wounds in the upper limb these were seldom encountered above the level of the lower third of the forearm In contaminated wounds in which infection had already secured a hold failure of regeneration after primary suture was almost inevitable In such cases it was wise to postpone nerve repair until the wound condition improved Referring to traction lesions of the brachial plexus Mr Platt said that the lesions in this group presented two distinct problems (1) the traction lesions of the infant during a difficult birth and (2) those of the adult usually caused by road accidents Most cases in the first group showed spontaneous recovery of varying extent in the first few months In the plexus lesions in the adult the degree of injury was much more severe

Surgical Intervention

Sir ROBERT STANTON WOODS discussed the question as to the conditions in which surgical intervention was desirable in the case of these injuries There were first general considerations such as age the presence of complicating disease or injury and the situation of the injury In the second place there was the nature of the injury and here an accurate history was most important Decision as to what to do might depend on which nerve was involved the musculo spiral was one of the most recuperable nerves in the body as opposed to the ulnar A further consideration was the degree of severity of the damage Electrical examination was of no assistance in the days immediately following a supposed injury to a peripheral nerve Electrical reactions gave indications merely of interference with the functions of excitability and conductivity

He indicated three essential respects in which the results of electrical stimuli applied to muscles and nerves in conditions of injury or disease of lower motor neurons differed from those in normal health No contraction was produced if the stimulus applied was a faradic one

the one put forward by Dr Goodfellow and accepted by Dr Blacklin With regard to Dr Blacklin's suggestion that coal adsorbs poisons, I should be glad to know what evidence there is that the surface of coal, even in minute particles is such that it possesses any adsorbent properties It seems to me that a possible explanation of cause and effect is being entirely overlooked—I am, etc,

London W C 1, Feb 4 THOMAS McLACHLAN

Faints and Fits

SIR—Dr A Rae Gilchrist's lecture (*Journal*, January 30, p 203) and Dr Broderick's letter (February 6, p 300) on this subject remind me of an experience of mine, twenty or thirty years ago, which shows the importance of distinguishing between fits and faints, whatever may be their primary origin

I was travelling in a railway train when an old gentleman who had been reading a newspaper and smoking a pipe suddenly collapsed I went to his assistance, and at first thought that he was dead I succeeded, however, in reviving him, and thought that he had had a bad fainting attack I sat down beside him in view of any possible recurrence After a little time, when he seemed quite recovered, he stretched out his hand and took hold of my hand I thought he was going to thank me for my attention, when, to my surprise, he carefully selected my index finger and proceeded to use it to clean out the bowl of his pipe I induced him to adopt another method, and he gradually recovered his intelligence For several years he and I usually travelled to London and back by the same trains, and he occasionally had similar attacks On one occasion he had an attack just before the train went into Cannon Street Station He started in a "subconscious condition to go through the traffic to the Stock Exchange where he worked, but I persuaded him to go with me and rest for a while in the waiting room

Another time he had an attack near his home station I got him out of the train, and called a porter to look after him Suddenly he turned and insisted on getting back into the train As the train was beginning to move I was in an awkward dilemma but just at that moment a fellow passenger handed out his beloved pipe, which was being left behind I gave it to him and all was well

—I am, etc,

Lingfield, Feb 7 HUGH WOODS M D

Is National Intelligence Declining?

SIR—I was very much interested in the searching commentary appearing in an annotation in the *Journal* of December 5 1936 (p 1150) concerning my recent research on mental capacity and the differential birth rate There are certain misapprehensions however, to which I feel some response is required

There seems to be current in the medical world the remarkable notion that the older an intelligence test is the better it must be The Binet test was rejected as an instrument in my survey because being the first intelligence test invented it takes no account of all the profound advances that have resulted in mental testing through the researches of Professor Spearman and his co workers The Otis test was rejected because it is an American test having a standardization which is about fourteen points out for English children I will not enlarge on these technicalities here since I have done so in my *Guide to Mental Testing* but any critical examination of the test actually used will show that the charge of being 'either unreliable or not satisfactorily standardized' applies rather to older tests and associated conceptions of the scatter of intelligence than to this latest product of painstaking research

That the conclusions are, as you say, depressing to any one having the welfare of the country at heart is a very mild statement of the position, but the way out does not lie in attempts to undermine confidence in the scientific soundness of this or any similar investigation, it lies in further investigation on a larger scale, followed by very definite action I trust that this criticism of the over-optimistic tone in which your commentary dismisses some of my conclusions will not be mistaken for any lack of appreciation of the valuable suggestions regarding possible errors in statistical technique These possible loopholes I have examined fully in a more lengthy treatise concerning this problem and the methods whereby it may be handled through social and medical services entitled *The Fight for Our National Intelligence*, which has recently been published with an introduction by Lord Horder—I am, etc,

Education Department, Leicester, Feb 2 R B CATTELL

Intraperitoneal Haemorrhage from a Graafian Follicle

SIR—With reference to Mr R R M Porter's letter on intraperitoneal haemorrhage from a Graafian follicle, may I mention that I saw a similar case about six years ago when I was an assistant at the City Hospital in Spremberg, Germany

A young married woman was suddenly taken ill with intense abdominal pain, vomiting, collapse, etc, and was admitted shortly afterwards to the hospital She looked very pale, had a rapid, feeble pulse, low temperature, and some rigidity and tenderness of the lower abdomen After diagnosing a ruptured ectopic pregnancy (of which we saw an unusually large number at that particular hospital) a laparotomy was performed

We found both tubes and the uterus normal, but there was a steady bleeding from a small ruptured Graafian follicle The amount of blood in the abdomen was comparatively little After wedge shaped resection of the follicle the defect was repaired and the abdomen closed Recovery was uneventful A microscopical examination was not made as there was nothing suggestive of an ovarian pregnancy

I apologize for not being more exact, but I am reporting the case from memory only—I am, etc,

Stoke on Trent Feb 8 S KLEIN, M D, F R C S Ed

Ducks and Bilharzia Disease

SIR,—While domesticated duck feed greedily on bilharzia-infested snails in South Africa, I was able, when working under the Streatfeild Research Scholarship, to show that they could not be persuaded to devour examples of *Melanoides tuberculata* Muller This widely distributed shell harbours a non-human schistosome in Egypt, but evidence is wanting that it is concerned with the spread of bilharzia disease, at any rate in Southern Africa Professor G A H Rose tells me he experienced the same difficulty in persuading domesticated duck to devour the stout shells of schistosome carriers in China

The African jacana, *A capensis*, whose native name in Zululand is Matanda etuba might well be protected, for this bird visits all pans and feeds on the snails from water-lily leaves But it is unreasonable to administer fines for the capture of wild birds by semi-starving natives, in which condition they themselves serve as carriers of disease, and greater consideration should be paid to the conservation of forests and the cultivation of native lands in tracts of country where bilharzia disease is rife—I am, etc,

F GORDON CAWSTON, M D

Durban South Africa Jan 6

of the volcanic ridges at altitudes between 2 000 and 4 500 feet and was especially connected with coffee production Here 40 to 60 per cent of the inhabitants were infected The disease did not exist endemically in Guatemala and Mexico below 2 000 feet because the species of Simulium by which transmitted the disease there did not breed below that altitude In the Province of Lusambo in Africa where onchocerciasis was prevalent the terrain was characterized by ridges and hills separated by narrow valleys containing swiftly running streams where Simulium bred extensively Here however the production of cotton and of mandioca and the collection of the piassava palm were factors predisposing to infection and it was these agricultural pursuits which especially brought the inhabitants into contact with the fly vector In Africa the black fly *Simulium damnosum* was particularly concerned in the transmission of the disease and in Lusambo *Simulium dinelli* was also implicated Both species of flies were frequently found breeding at altitudes below 1 000 feet and in Liberia Sierra Leone and parts of the Belgian Congo onchocerciasis was prevalent at altitudes at or below 1 500 feet Furthermore in parts of Africa 33⅓ per cent of wild flies were discovered to be infected compared with a maximum of 5 per cent in Guatemala This accounted for the greater number of nodules found in Lusambo patients where as many as 150 might be counted in one individual In other places two to six appeared to be the number generally present

Treatment consisted in surgical removal of the nodules or in destroying the parasites by the injection of drugs such as gentian violet or hexylresorcinol In Guatemala there was evidence that treatment of infected individuals by destroying the focus of infection was a helpful prophylactic measure but in Africa where conditions were different eradication of human infection would be entirely impracticable apart from the elimination of the fly vector

Professor D B BLACKLOCK who had first established the transmission of *Onchocerca volvulus* by *Simulium damnosum* in Africa said he had not been able to find an association between eye lesions and *Onchocercus volvulus* infestation in Sierra Leone He had found only one village in which the nodules were prevalent on the heads of the patients Here sixty six people were examined, thirty three had nodules on different parts of the body but in only eight of these were they present on the head This village was overhung with enormous trees and Professor Blacklock suggested that in South America frequency of nodules on the head might be associated with the overhead shade provided by the coffee planters combined with the fact that people were better clothed With regard to prevention many suggestions had been made for eradicating the fly vector Hissette had advised the clearing of the ground for 500 metres from habitations Such a measure might be largely successful in localities such as Sierra Leone where the fly hid in the tall grass and did not come out any long distance to attack

"THE FRONTIERS OF PSYCHOTHERAPY"

At a meeting of the British Psychological Society (Medical Section) on January 27 Dr H CRICHTON MILLER delivered his address from the chair in which after some personal references he discussed with acknowledgements to the title of a recent book by Professor McDougall 'the frontiers of psychotherapy

The first and in many ways the most obvious frontier was neurology, a frontier that had long called for a commission of delimitation Here Dr Crichton Miller took as an example the apache type of the post-encephalitic a patient whose symptoms were a conduct-disorder and therefore on the psychotherapist's side of the frontier The aetiology however was an infection of the central nervous system and as such was in the territory of the neurologist The psychologist could provide a special and constricted environment for the patient, the neurologist could prescribe the appropriate dose of hyoscine or other palliative In what quarter was to be sought any real hope of prevention if not of cure? Surely from the bacteriologist who in collaboration with the clinician would one day be able to cut short an attack and ensure no degenerative sequelae If the psychotherapist was obliged to recognize his curative limitations it was useless for him to turn to the neurologist for help as the neurologist could provide only diagnosis and medicinal palliation

The neurologist and the pathologist were apt to extinguish aetiological speculation by saying There is not a shred of evidence to support — this or that hypothesis generally meaning that there were no post mortem findings Why should there be? They had all treated the morbid blusher the blushing had a special and constant distribution, it was objectively verifiable and yet no one would expect the phenomenon to be recognized post mortem He conceived of the brain tissue as susceptible of transitory vicissitudes capable of modifying function without any permanent interference with structure It looked as if psychotherapy when it was not self supporting could not hope for much assistance from the neurological side of the border

The Physiological Frontier

The physiological frontier was one where psychotherapists would often have difficulty in justifying their claim Psychotherapy had been cursed almost since its inception by an easy assumption that functional nervous disorders were psychogenic in origin It was a fallacy that what was functional had to be treated on psychological lines and also a fallacy that because a condition was curable by psychotherapy psychotherapy was the best cure for it He had known cases of chronic constipation cured by Christian Science He neither denied this fact nor did he recommend his constipated patients to become Christian Scientists Similarly with anorexia nervosa the subject of a recent article in the *British Medical Journal* (December 5 1936) in which it was stated that early diagnosis depended on rapid exclusion of organic disease and recognition of the characteristic mental picture He wondered which of them had ever seen let alone recognized a case of anorexia nervosa in which there was no constipation menstrual inadequacy or anaemia He had no desire to keep anorexia nervosa on the psychological side of the frontier He would retain his liberty of action and when he found hypogonadism he would proceed to use those preparations now fortunately available which used with reasonable intelligence would rectify the amenorrhoea at the same time applying such analytical skill as he could command to the elucidation of the inevitable Electra complex

After discussing other borderline conditions he deprecated the unwillingness of the psychotherapist to prescribe any of the preparations which the lesser breed of endocrinologists had found useful in such cases Twenty-five years ago when he read his first paper in London his argument was Determine the major aetiological factor and treat it and he found himself reverting to that theme The sooner the frontier between endocrinology and psychotherapy was obliterated the better for their patients

Sociology, Philosophy, and Religion

In considering the relation of practical psychotherapy to sociology it must be remembered that the bulk of their patients came to them because they were maladjusted to society To day society was looking to the psychologist for advice and to the psychotherapist for treatment This frontier was one of great importance as it lay at the root of human evolution The problem might be formulated in some such terms as these How far could mankind undergo further differentiation and yet endure the herd life that was necessarily based upon average contribution and standardized treatment? One contribution which psychopathology might usefully make was the correlation of delinquent trends with abnormalities of physical func-

department of Birmingham University and under Professor Lewis's supervision that a thorough investigation of psittacosis was made about seven years ago On retirement from the active service of the University in 1935 he was made emeritus professor He joined the British Medical Association in 1888, and at the annual meeting held in Birmingham in 1911 was vice president of the Section of Pathology

It is with regret that we record the death of Dr James Maxwell Warnock at his home in Newtownards, Co Down, on January 31 He had been a victim of the prevailing epidemic of influenza, and had been advised to take a holiday to convalesce, but refused to leave his patients In outcome of his self-sacrifice was that he developed pneumonia, and this proved rapidly fatal Dr Warnock was a student of Queen's College, Belfast and graduated M B, B Ch in the Royal University of Ireland in 1906, and proceeded to the M D in 1916 He acquired valuable experience in practice in England for two years and then settled at Newtownards, where he soon became one of the prominent medical men in the Ards peninsula, acting as medical officer to the Union Infirmary, which was later converted into a modern district hospital The Ards was his birthplace, and he looked upon it with admiration, the citizens of the peninsula soon held him in equal respect and esteem in his professional activities, and the number of his patients is a tribute to his ability and character He was universally popular with colleagues and patients, and his death is a loss to the district which held him in such high regard Dr Warnock was of a quiet, unassuming temperament, conscientious in the fulfilment of his duties, and always prepared to help a friend He was a regular attender at meetings of the British Medical Association and the Ulster Medical Society With his widow, two sons (one of whom is a doctor and the other a medical student), and his daughter there is widespread sympathy in their bereavement

Dr Edward Watson Palin, who died on January 19 in St Thomas's Hospital, was aged 68 years, and had been in general practice for about thirty-two years In 1895 he graduated M A, M B, B Ch at Oxford, obtaining the M R C S and L R C P diplomas, and then acted as house-physician and clinical assistant in the rural department at St Thomas's For about two years he practised at Ross-on-Wye, Herefordshire, and then settled at Fakenham, Norfolk, in partnership with Dr W H Fisher He was Poor Law medical officer for Mitford and Launditch Union During the war he formed the Fakenham Branch of the St John Ambulance Association and acted as medical officer For many years Dr Palin was a member of the British Medical Association He was a keen Freemason and much interested in parochial affairs He was also an expert gardener and photographer, and exhibited in London and other places He retired to Chalford Hill Gloucestershire, five years ago On January 24 memorial services were held at Fakenham Parish Church and were largely attended

We announce with regret the death, on January 31, of Dr Henry Holt of Bournemouth After studying at Owens College, Manchester, Dr Holt qualified M B, Ch B in 1900, and then went on to the Middlesex Hospital and took the D P H of the English Conjoint Board in 1905 He acted for a time as house-surgeon to St Mary's Hospital for Women and Children Manchester, and later as house surgeon to the Stanley Hospital Liverpool He was appointed assistant to the medical officer of health for Stockport and in the course of his work there wrote a thesis on "The Place of Vaccine Therapy in the Treatment of Gonorrhoea" for which he was awarded the M D of Leeds in 1918 He was at one time president of the Stockport Medical Society, and first joined the British Medical Association in 1902

We regret to announce the death of Dr Hugh Meyrick Meyrick-Jones of Haunton, Cambridge, on February 2 He received his medical education at Guy's Hospital, and qualified M R C S, L R C P in 1893, and afterwards spent a few years at Crewkerne, Somerset He took the degrees of M B, B S at the University of Durham in 1896 and proceeded M D in 1898 In the latter year he settled in practice at Guilsborough, Northamptonshire where he held the appointment of public vaccinator to the No 2 District of the Brixworth Union In 1901 he moved to Charlton Kings, Cheltenham He became medical officer of health to the local urban district council in 1909, and held that office until 1922 In 1911 he was appointed honorary radiologist to the Cheltenham Ear Eye and Throat Hospital and General Hospital and in the same year he became a member of the Rontgen Society He went to live at Cheltenham during the war and on his retirement in 1928 moved to Cambridge, where he received the appointment of demonstrator in radiology and electrology in the University The degree of M A (*honoris causa*) of the University was conferred upon him in 1931 Dr Meyrick-Jones had been a member of the British Medical Association for forty years He was president of the Gloucestershire Branch in 1921–2, and when the Association held its annual meeting at Manchester in 1929 he held office as secretary of the Section of Radiology and Radiotherapeutics

Dr George Francis Bradley, who died at Lutterworth, Leicestershire, on February 2, received his medical education at the London Hospital, and qualified M R C S, L R C P in 1911 He held a number of resident appointments at the hospital and graduated M B B S at the University of London in 1913 He then settled in practice at Halstead, Essex, where he became surgeon to the local cottage hospital After moving to Lutterworth he was appointed certifying factory surgeon for that district in 1931 He was also surgeon to the Lutterworth Cottage Hospital and local medical officer to the Post Office Dr Bradley had been a member of the British Medical Association since 1916

Dr Thomas Forde of Shipsford, Denaby, died on January 23 aged 54, from pneumonia following influenza For over a fortnight he had worked many hours a day visiting influenza cases in the Conisborough and Denaby district, where he practised for twenty-three years Dr Forde was born at Cork and studied medicine there graduating M B, B Ch of the Royal University of Ireland in 1908 After several voyages as ship surgeon he practised for a time in South Wales, and held a temporary commission in the R A M C during the war He was for many years a member of the medical staff of the Fullerton Hospital, Denaby, and surgeon to the local branch of the St John Ambulance Brigade He had been a member of the British Medical Association since 1912

We regret to announce the death on January 29, after a short illness of Dr Alfred Bertram Vine M B E of Bury, Lancs A student of the Middlesex Hospital Medical School, Bertram Vine obtained the English joint qualifications in 1899 and graduated M B Lond in 1901 After serving as house-physician at the Middlesex Hospital he settled in practice at Bury, and for some years was honorary physician to the Bury Infirmary He joined the British Medical Association in 1911, and was a member of the Manchester Clinical Society

The following well-known foreign medical men have recently died Dr Bindo Dr Vecchi professor of morbid anatomy and rector magnificus of the University of Florence, aged 59, Geh.-Med Rat Dr Richard May formerly extraordinary professor of the history of medicine at Munich, aged 74, and Dr Heinrich Gerhartz, extraordinary professor of internal medicine at Bonn and authority on tuberculosis and the cerebral nervous system aged 58

and the condition of a closed infection arose, so that antibody production increased rapidly This being so a positive gonococcal complement fixation test might be taken as evidence of present or immediately previous gonococcal infection but a negative test did not exclude the possibility of gonorrhoea

The possibility of cross fixation with antibodies of allied bacteria such as *Micrococcus catarrhalis*, the meningococcus, and *Micrococcus flavus* had often been raised, and the evidence on this question had not been altogether conclusive Dr Orpwood Price had carried out a series of experiments in which he prepared antisera against the gonococcus, *Micrococcus catarrhalis*, and *Micrococcus flavus* by injecting rabbits with these bacteria The sera were then tested against gonococcal antigen in serial dilutions ranging from 1 in 10 to 1 in 80 as for a complement fixation test These experiments showed that a weak degree of cross fixation with the antibodies of *Micrococcus catarrhalis* was liable to occur

Test of Cure

Dr Dukes referred also to Dr Price's views on the gonococcal complement-fixation reaction as a test of cure As long as a patient had a persistently positive complement fixation test he should be regarded as infective and remain under medical supervision When the test became negative after having previously been positive this in itself must not be taken as evidence of cure In any test of cure both clinical and pathological examinations must be considered and it was suggested by Price that if the patient showed no clinical signs or pathological evidence of the disease normal life with the single exception of coitus should be allowed for one month Then the patient should be re examined and all tests repeated If these still yielded negative results a further month of normal life should be allowed before the final tests were made When these were satisfactory the patient might be regarded as cured The gonococcal complement-fixation test could not be regarded as a substitute for other methods of deciding when a case was cured Its evidence should always be supported by the results of smears and cultures

Diagnosis of Syphilis

The second half of the morning session was devoted to a discussion on the diagnosis of syphilis introduced in the first place by Dr J G GREENFIELD with a paper on the cerebro spinal fluid in neurosyphilis He pointed out that the four reactions proposed by Nonne in 1909 still remain the most important for the examination of the cerebro spinal fluid in syphilis These four reactions are the cell count, globulin estimation, Wassermann reaction in blood and cerebro spinal fluid, and a colloidal reaction Dr Greenfield discussed these in turn and then took up the question of the cerebro spinal fluid at various stages of syphilis and its relation to treatment In the secondary stages of syphilis meningeal reactions may occur in a small proportion of cases but since the majority are not followed by neurosyphilis it seemed unnecessary to perform lumbar puncture on patients before or during treatment unless there were clinical signs of syphilitic meningitis, in which case lumbar or cisternal puncture was a curative measure

Only those cases in which meningeal reactions persisted into the latent period appeared likely to develop neuro syphilis, and therefore the best time to examine the cerebro spinal fluid in the earlier stages was a year after a complete course of treatment or at the end of the third year after infection More frequent punctures during the secondary stage were not contraindicated but the appearance and disappearance of meningeal reactions should not be allowed to influence treatment

In the later stages a certain diagnostic and prognostic value attached to the rapidity with which the Wassermann reaction in the fluid cleared up under treatment and to variations in the Lange reaction Although it was generally true that in meningo vascular forms of neuro syphilis the Wassermann reaction in the fluid cleared up rapidly under treatment, there were many chronic cases of meningeal syphilis in which this rule did not hold good In tabes and general paralysis the Wassermann reaction in the fluid was very stable and usually only weakened along with the weakening of the Wassermann reaction in the blood But after malarial treatment in favourable cases the Wassermann reaction in the fluid might clear up fairly rapidly, while the blood Wassermann reaction remained strong In the latter type of case examination of the fluid at intervals was of definite prognostic value and enabled relapses to be detected and treated at an early stage Variations in the Lange reaction were also of value in prognosis, weakening of the reaction in a general paralytic after treatment with malaria or trypars mide being usually of good omen, while a progressive strengthening of the reaction in cases of tabes or old standing syphilis pointed to the onset of general paralysis

Dr H C LUCEY read a short paper entitled Wassermann Snags in which he gave his experience of certain practical difficulties in the performance of this test and ways in which they might be overcome

Congenital Syphilis

Dr A G SIGNY opening a discussion on congenital syphilis said that in view of the general difficulties met he would describe various methods available for collection of reasonable specimens of blood from children He described the puncture of the anterior fontanelle the external jugular vein and the internal jugular vein He then stressed the importance, in testing the blood of children of doing at least two types of tests—a recognized complement fixation as well as a recognized precipitation test He then discussed in detail the interpretation of the results of these tests particularly the anomalous results which are occasionally met with He emphasized the necessity of a repeated test before a diagnosis of syphilis is made from serological evidence alone especially in young infants who are quickly made negative on treatment The value of a provocative injection of arsenic was pointed out in doubtful or weak positive reactions The histology of congenital syphilis was briefly described and said to be characteristic in many organs especially the liver He then discussed the anaemias of congenital syphilis and described how readily the children improve as the syphilis clears up under specific therapy

Dr DAVID NABARRO stated that investigations carried out at Great Ormond Street showed more than half of the congenital syphilitic infants seen to have positive findings on examination of their cerebro spinal fluids As a rule this condition responded readily to the recognized treatment by injections and in his experience the fluid which had once become negative very rarely altered In the majority of these cases the neurosyphilis was latent but sometimes there were signs or symptoms such as hydrocephalus convulsions, and possibly mental retardation In his opinion a lumbar puncture should be carried out in every case of congenital syphilis in order to detect latent neurosyphilis especially in rather older children and to treat it so as to prevent such untoward events as hemiplegias meningo vascular lesions leading to mental degeneration and so on In his experience the treatment of neurosyphilis with clinical manifestations in children was most disappointing and on that account he strongly urged the routine lumbar puncture of all congenital syphilitics

In reply to a question from Dr GOODHART as to whether he had seen the symptoms in pregnant mothers diminish in intensity Dr NABARRO stated that in his experience the majority of syphilitic mothers showed no signs or symptoms of the disease with the exception of a positive reaction in the blood It was stated that the blood reaction became negative during pregnancy and this was adduced as a reason for not doing routine blood tests on expectant mothers and particularly those who attended ante natal clinics In Dr Nabarro's experience the

men, and women in a similar economic position it was hoped that the financial arrangements would enable local authorities to provide a complete service at home at a fee not much, if at all, higher than was at present payable for the services of a midwife alone Women could then authorize payment to the local authority out of the maternity benefit The payment for services rendered by the doctors would be made by local authorities in accordance with scales fixed by the latter after consultation with the appropriate organizations of doctors The additional expenditure when the new services were in full operation, after taking account of fees recovered, might reach £120,000 a year Clause 3 of the Bill proposed a grant equivalent approximately to half the total additional expenditure of each local authority The grant would be scaled up and down in proportion to the needs of the authority determined under the formula of the 1929 Local Government Act He was prepared to move an amendment that the Bill should not come into operation until May 16, which was the day after the new block grants had begun Local authorities would also receive Exchequer help in the amount of their liability for compensation to midwives who retire in the three years following the commencement of the Bill One half of the compensation paid in all cases during that period would be borne by the Exchequer

Among the points which would arise in committee was the concern felt by the universities and teaching institutions about the cases that would be available for the training of medical students in midwifery The Bill provided that the local authorities and the Department should have regard to the desirability of maintaining facilities for teaching

NUTRITION AND THE BILL

Mr T Johnston said the Opposition approached the measure with sympathy Mr Elliot had not explained why the Scottish maternal mortality rate was 15 per cent worse than that in England, nor why, in a model area in London, instead of a death rate of 6 per 1,000 as in Scotland, it had been reduced to 0 68 There was nothing in the Bill about malnutrition What provision would be made in the regulations for seeing that women undernourished from long poverty and underfeeding were provided with the necessary nutrition?

Dr Elliot had explained that the Bill provided for the consultation of existing voluntary associations Mr Johnston thought this necessary in many rural parts of the country where these associations had grown up over many years and some were efficient He criticized, however, the drafting of the provisions dealing with them Clause 1 of the Bill said that the period of domiciliary treatment by a midwife was to be only the lying in period The English Act prescribed fourteen days He discussed the working out of the new grants for maternity services in association with the block grants and asked whether after May 16 Edinburgh would be guaranteed 50 per cent of her expenditure on maternity services

Mr Elliot said he thought that the percentage would not be increased and might be slightly diminished under the new formula The distribution of the money available would be according to the needs of the population and he was willing, later, when the block grant and the weighted formula had been agreed upon to circulate a statement showing what each local authority in Scotland would receive The new formula would on the whole advantage the densely populated areas, the sparsely populated areas, and the poor areas rather than the richer ones

INSTRUCTION IN DOMICILIARY MIDWIFERY

Mr Graham Kerr said that one point of fundamental importance merited the consideration of the House Many of those best qualified to speak on the improvement of domiciliary midwifery in Scotland told him that unless the Bill was amended at one point it would bring about actual deterioration in domiciliary midwifery There happened to be statistical information on this matter In 1933 a report was published in New York upon mortality in connexion with confinement based upon 348 310 cases This showed that in cases dealt with in splendidly equipped hospitals the death rate was 4 5 per 1 000 whereas in confinements in the patients' own homes the death rate was 1 9 per 1,000 Of course in hospitals a greater proportion of abnormal cases was found but the House was safe in taking these statistics and a great mass of similar evidence from elsewhere as justifying a declaration that the day was not yet ripe for treatment of midwifery cases in general in hospitals As a biologist it appeared to him that no more difficult task faced society than the improvement of domiciliary midwifery From that point of view the most important thing was to ensure efficient training in midwifery for the midwife on the one hand and the practitioner on the other The Scottish universities and the great maternity hospitals of Scotland represented to him that the present Bill failed to ensure this The University of Aberdeen said the omission would in the long run defeat the object of the Bill Glasgow Maternity Hospital, the largest in the country and the largest training centre for midwives in Great Britain, said the Bill in its present form would wreck the outdoor service of the hospital which was essential for training students and midwives A similar opinion was expressed by Dundee Maternity Hospital, which last year was responsible for over 50 per cent of births registered in the city of Dundee He hoped the Government would agree to a new clause worded in this way

In every area where there is a recognized medical school the local authority of that area and the Department of Health shall take steps to secure that adequate facilities are made available for the practical domiciliary instruction in midwifery of any person undergoing training with a view to becoming a duly qualified medical practitioner or a certified midwife

Mr Leonard asked whether it was possible, since a great number of doctors did not like to share in nor did they specialize in this work, for the consultation to be conducted with a panel of practitioners who had paid special attention to the subject He hoped that the period during which unqualified persons were prohibited from giving service would be extended to fourteen days as in the English Act Competent opinion was that on the tenth day difficulties arose which needed to be watched Under the Bill persons working in certain institutions were exempt from any penalty if they acted at a confinement One such institution was a maternity home, but there were respectable maternity homes where no one was qualified under the Bill except the matron, and he did not see why penalties should not be imposed when they were imposed on other people perhaps as fully qualified as the nurses in maternity homes The same applied to mental asylums Why should it be necessary to make an exception in the case of a birth taking place in mental asylums? With regard to Clause 7 he asked, on behalf of the city of Glasgow, whether those who attended refresher courses would incur expense and whether that expense would rank for grant under the financial arrangements of the Bill Additional hospital accommodation would be required for ante natal and other purposes, and the cost of that should receive consideration at least in regard to capital charges

Mr Allan Chapman said that hospitals existed for the benefit of poor persons and the former naturally sought experience for their trainees among the people whom they served This point caused great anxiety among Scottish hospitals, and he hoped the Lord Advocate could announce some form of compromise Extern training was of equal if not of greater importance than intern training for the object of this Bill He therefore urged that provision should be made for external training the mothers being protected by a requirement that a certificated midwife should always be present without exception when a trainee handled a case

MEDICAL OPINION OF THE BILL

Sir Ernest Graham-Little said an opportunity had been missed in framing the Bill The recommendations of the admirable report on maternal mortality and morbidity in Scotland should have been more closely followed The report stated that

> "Ante natal intra natal, and post natal supervision should be afforded by the same medical attendant where this is impossible the ante natal record should be readily and immediately available to the attendant at confinement"

build a new wing for ear, nose, and throat wards and also wards for septic cases, as the accommodation for these two departments had for long been unsatisfactory The Western Infirmary had not so far been able to provide accommodation for patients who were able to contribute to their treatment but it was now proposed to erect on the east side of the main drive a block which would be available for paying patients The plans for this building were in process of adjustment it was expected that the building would provide some fifty beds It was hoped that Sir Thomas Lipton's trustees would make grants enabling the managers to erect this building in memory of Sir Thomas Lipton An extraordinary general meeting of subscribers was held after the ordinary meeting at which a special resolution was unanimously passed giving the managers power to provide accommodation for paying patients

Chair in Dental Surgery at St Andrews

At a meeting of the General Council of St Andrews University on January 30 a draft ordinance relating to a chair of dental surgery to be instituted at this university was unanimously approved Mr James Allison said that the ordinance provided for the endowment of a chair in dental surgery in the faculty of medicine This had been made possible by a gift to the University Court of a sum of £17,500 by Mr and Mrs William Boyd West Ferry, Dundee in seven annual payments of £2 500 and it was hoped that an additional grant would be forthcoming from the Dental Board, which would enable a full salary to be paid to the professor At the same meeting it was stated by Principal Sir James Irvine that the number of students at the University during the past year had been 1 062, including fifty two research students In the current year there had been a slight fall in the number of full time students to 930 such a fall however being the general experience of all the universities He also stated that the University had received a benefaction of £4,000 from Dr William Low late rector's assessor to the University Court which had been devoted to the provision of a medical hostel in Dundee so that students engaged in midwifery could live in the immediate vicinity of the hospital

---

E F King (*Brit J Ophthal* October, 1936, p 561) estimates that there are fifty to one hundred cases of leprosy in the British Isles Ten of the fourteen cases he has seen have ocular lesions, some only observable with the slit-lamp Supraciliary thickening with loss of eyebrows, diffuse lid infiltration with nodules, and loss of eyelashes are common Involvement of the seventh nerve reduces blinking, causes fibrillation of the orbicularis, and later paralysis and ectropion Leprosy of the palpebral part of the lachrymal gland may call for excision and the lachrymal sac and non lachrymal duct may be obliterated Anaesthesia of the conjunctiva and cornea is almost constant and an episcleral nodule in the upper temporal quadrant of the limbus symmetrical in the other eye, is characteristic The nodule tends to spread round the limbus and into the cornea when an anterior staphyloma may occur and possibly perforation A leprotic superficial keratitis with a greyish milky substantia propria and scattered white chalk like dots is distinctive This condition may clear with treatment Corneal abrasion and ulceration is uncommon Acute iritis, iritic nodule at the angle, and, most often, iridocyclitis with non pigmented punctate keratitis, and a number of grey discrete pathognomonic spots on the iris are often seen The iridocyclitis is similar to heterochromic cyclitis With the exception of the deep infiltration of leprotic interstitial keratitis lepra bacilli are readily found in the various lesions The main general treatment is the injection of chaulmoogra oil Probably all subconjunctival injections are useless but excision of the episcleral nodule is useful in preventing local extension

Correspondence

Blood Group Tests in Disputed Paternity

SIR —Dr P L Sutherland's interesting letter in the *Journal* of February 6 (p 299) raises a number of points concerning the practical side of blood group tests As we did not discuss this aspect of the subject in our paper we would be grateful for your permission to amplify some of the points raised by Dr Sutherland

The particular technique to be employed for the setting up of the tests is perhaps best decided by the past experience of the individual worker in the field Personally we prefer a modification of the Martley–Roche Lynch technique which has proved satisfactory in our hands

We are in agreement with Dr Sutherland regarding the necessity of having blood of all type for control purposes and for the supply of test corpuscles and sera We make a practice of having readily available a sufficient number of volunteers (laboratory staff, students etc) whose blood type have been determined repeatedly and we think that freshly *prepared corpuscle suspensions from normal individuals of* established type are decidedly superior to those prepared from chance specimens of pathological bloods submitted for Wassermann tests and other tests as is suggested by Dr Sutherland

The necessity for controls is even greater in M and N tests than in A and B tests since the agglutinin for M and N are not present in man and have to be developed artificially in the rabbit Such rabbit sera may contain the agglutinins for A and B developed as a result of the injection of the appropriate red blood corpuscles and such agglutinins have to be removed by adsorption with A and B corpuscles before the sera can be used in testing for the M and N factors As the agglutinins for M and N are not present in human sera there is no cross check as exists with the A and B factors so it behoves the worker to make doubly sure of the specificity and potency of his M and N sera by exacting controls especially too as rabbit anti M and N sera deteriorate in an irregular manner

It is our practice to have available a sufficient number of persons whose blood type were originally determined from sera kindly supplied by Professor Thomsen of Copenhagen These known type bloods are used for the preparation, adsorption and testing of our antisera For the actual tests we believe that unless bloods are available from persons who are known to be M, N or MN it is essential when examining a set of unknown bloods, to test them with sera from two different sources but this only 'second best' —We are, etc

Nasal Sinusitis in Children

SIR —In the *Journal* of January 2 (p 24) there was reviewed some excellent work on this subject done by Mr Crooks who contributed an article to the December issue of the *Archives of Disease in Childhood* (1936) From both the original work and the leading article in the *Journal* I gained the impression that Mr James Crooks's very complete investigation of his cases in Edinburgh had compelled him to the conclusion that adenectomy and tonsillectomy resulted in only a very small proportion of cures in sinusitis I had reached much more hopeful conclusions after some few years investigation of this subject and since my work was on children living under conditions different from those of the Edinburgh children,

Part I, which deals with general provisions as to health, strengthens the existing provisions and also introduces new proposals The requirements as to cleanliness are made more precise The amount of cubic space required per person is increased from 250 cubic feet to 400 cubic feet, in existing workrooms the present standard will continue to apply for five years and longer if effective mechanical ventilation is provided In addition to requiring effective provision to be made for securing and maintaining a reasonable temperature in all workrooms a standard of temperature is laid down for light sedentary work, and the Secretary of State is given power to prohibit the use of unsuitable methods of heating The most important new proposals included in Part I are those for securing sufficient and suitable lighting and for the medical supervision of the workers in certain circumstances—for example, in outbreaks of disease

SAFETY AND GENERAL WELFARE

In Part II the provisions of the existing law have been largely recast New proposals provide for the adoption of various safety devices or arrangements, impose duties on manufacturers in regard to the construction of new machines, require precautions in the case of cranes, chains, steam receivers and containers, compressed air receivers, processes involving risk of explosion from dust or fumes, and various other matters Specific requirements are laid down with regard to hoists and lifts

The provisions in regard to means of escape in case of fire are considerably extended The Bill secures that where in any factory more than twenty persons are employed in the same building, or explosive or highly inflammable materials are stored or used, effective arrangements shall be made for giving warning and for familiarizing employees with the means of escape and the routine to be followed in case of fire

Part III deals with general welfare—that is, the provision of drinking water, washing facilities, and accommodation for clothing in certain prescribed processes, and facilities for sitting for female workers Part IV contains important new proposals for health, safety, and welfare The existing provisions as to the removal of dust are strengthened while new ones are introduced to control underground workrooms in factories Power is given to make regulations prescribing the maximum weights to be lifted by young persons and also by men and women Part V, which relates to the notification and investigation of industrial accidents and diseases, reproduces substantially the existing law

HOURS OF EMPLOYMENT

Part VI deals with the hours of employment of women and young persons At present women and young persons may work in any week up to a maximum of sixty hours in non-textile (fifty-five and a half in textile) works, exclusive of intervals for meals and in addition, women may under the present Act be employed on a limited amount of overtime in certain trades The Bill secures that the weekly working hours shall not exceed forty eight, and that the daily working hours shall not exceed nine, exclusive of intervals for meals Every factory will be permitted, in the case of women and young persons over 16 years, an aggregate of one hundred hours overtime in the year, provided the overtime is not more than six hours in any week and only takes place during thirty weeks in the year Overtime for women may be increased to 150 hours in trades subject to seasonal or other pressure, and in proper cases the requirements as to the weekly maximum and the number of weeks may be relaxed Young persons under 16 are not to be allowed to work overtime, and provision is also made for reducing the amount of overtime for young persons over 16 in any process in which overtime employment is shown to be prejudicial to their health

Part VII following the existing Act, applies certain provisions of the Act to docks wharves, quays, and warehouses, it also applies certain provisions to certain processes carried on in ships in a harbour or wet dock which are not at present under the Act to building operations which are only partly within the Act and to works of engineering construction which now come within the scope of the Act for the first time Parts VIII and IX re enact the existing provisions in regard to homework and the supply of particulars to piece workers Part X continues with modifications a number of existing miscellaneous provisions but contains a new one requiring employed persons to use the appliances provided for their health or safety and not wilfully or without reasonable cause to do anything likely to endanger themselves or others Part XI contains the administrative provisions relating to the appointment powers and duties of inspectors and the appointment and duties of examining surgeons (the new name for the certifying surgeon) Part XII re enacts with modifications the provisions with regard to offences and penalties and legal proceedings

Parts XIII and XIV deal with the application of the Act and general interpretation, and defines the term factory

It is proposed that the Bill shall come into force on July 1 1938, but the Secretary of State is given power to postpone up to January 1940, the operation of any particular provision in Part II This would enable special treatment to be given if necessary to any depressed industry which might find it specially difficult to comply with the provisions in question

Royal Commissions and Inquiry Committees

The following statement gives particulars of certain Royal Commissions and Committees of Inquiry (excluding Standing and Statutory Committees) appointed by the Government during the last or previous Parliaments which are still sitting

Name of Commission or Committee	Object of Inquiry	Remarks
Local Government and Public Health Law *Consolidation*	To consider the grouping of enactments in regard to consolidated legislation	First Interim Report March 1936 Second Interim Report January 1936
Flats for the working classes	To inquire into methods of construction etc of flats suitable for the working classes	Interim Report May 1935
Noise	To consider the principal causes of noise in the operation of mechanically propelled vehicles	First Interim Report August 1935 Second Interim Report July 1936
Poor Law (Scotland)	To examine the existing statutory provisions relating to the relief of the poor in Scotland	
Workmen's Compensation Acts	To inquire into and make recommendations on— (i) the operation of the Acts in relation to workmen affected by miner's nystagmus (ii) the system of medical examination and certification by medical referees and certifying surgeons in force under the Acts To inquire into and to report on the working of the provisions and practice relating to the settlement of workmen's compensation claims by the payment of lump sums	

Southampton Nursing Homes and Notifiable Diseases

The Southampton Corporation Bill was read a first time in the House of Commons on February 2 Clause 33 provides that no person suffering from a notifiable disease shall be admitted for treatment to a nursing home in the borough except with the consent of the medical officer If any patient in a nursing home is found to be suffering from a notifiable disease the person carrying on such a nursing home shall forthwith notify the medical officer, and such patient shall not continue to be treated in the nursing home except with the consent of the medical officer

The Bill also contains provision for the registration of hairdressers and barbers' premises The council also seeks powers to make by-laws to secure the cleanliness of the premises and of the instruments, towels, and materials used therein Provisions of a similar nature regarding hairdressers' premises are contained in the West Ham Corporation Bill and the Rotherham Corporation Bill both of which had been read a first time in the House of Commons

Nutrition of School Children

Mr SHINWELL in the House of Commons on February 3 initiated a debate on the feeding of children He moved

> 'That in view of the disquieting reports regarding the physical condition of children this House is of opinion that out of moneys provided by Parliament provision should be made for supplying in addition to milk at least one meal per day to every child attending an elementary or secondary school

He said his motion did not go as far as the Labour party would desire They wanted all children at school or otherwise to be provided on every day of the year with all meals required for their sustenance Some improvement in health

By the preliminary x ray method advised above in primary and recurrent cases the risk of operation or interstitial radium causing dissemination (and some breast tumours appear to be as highly metastatic as a lymphosarcoma) is reduced to a minimum Some cases seen after operation or interstitial radium have had such wide spread recurrences or unusual metastases that dissemination has been strongly suggested though impossible perhaps to prove (except by analogy with animal experiments)

The "power of x rays does not depend on the wave length, as Mr Rowntree seems to suggest, or above a certain voltage, not to any practical extent, instead their power' depends on the various factors of dosage and the method and skill of application employed The good results obtained in skin epithelioma with low voltage x rays high voltage x rays, or with radium appear to prove the relative unimportance of wave length (if suitable cases and technique are chosen) as compared with quantity absorbed and the time factor

Such great advances have been made in the methods and technique of x ray therapy in breast cancer in recent years that I am in warm agreement with the opinion expressed by a well known radiologist from abroad at an informal discussion on the methods possible for the treatment of cancer of the breast 'Well, x rays for my friends' '—I am, etc

London W1 Feb 6 J H DOUGLAS WEBSTER

Sclerosing Submucosal Injection of Turbinates

SIR—On the importance of conserving the ciliated surface of the nose everyone will agree I heartily endorse Mr C A Hutchinson s condemnation of the electrocautery as a means of removing unwanted tissue but I venture to raise a doubt as to the method proposed by him (*Journal* January 9, p 72) or that of Dr James Adam (January 30 p 245) being the best alternative

If the turbinates are too large they may be tucked by snipping or snaring away the redundant portion not only with complete safety and a quite negligible scar but without interference with the histological structure of the erectile tissue of which they are composed, and whose function is perhaps not yet quite understood It is remarkable how great an effect a quite small button removed in this way can have on the freedom of the passage The method is so simple and so surgical that I can see no reason for devising sclerosing injections

As to pushing a cautery into the turbinal tissue this method had a vogue about twenty-five years ago but was found to be dangerous Cases were reported where pyaemia supervened The cause was not far to seek The cautery caused a local necrosis in the middle of a venous structure the necrosed tissue became infected, and the ideal conditions for supplying bacteria to the blood stream were established—I am, etc,

Dublin Feb 2 ROBERT H WOODS

Inhalational Therapy

SIR—I was interested to read Dr Ellman s letter in your issue of January 30 (p 244) and his appreciative reference to the timely leading article on the subject in the *Journal* of January 23

As a member of the small band of pioneer workers formed in 1928 for the study and investigation of inhalational methods of medication, I regret that the British Society (which numbered among its members some leading practitioners) came to so untimely an end after a existence for lack of support by members of our profession The journal of the society published a few valuable and informative articles on inhalation therapy by Continental writers, but the good work the society might have done was handicapped by events peculiar to all new movements not really understood and to circumstances which a small but enthusiastic band of pioneers in blazing a trail' must necessarily find themselves liable to It is gratifying therefore, to learn that this branch of physical medicine has recently aroused a wider and keener, if belated interest The treatment by inhalation of finely nebulized vapours and pharmacologically active drugs is so comparatively new to this country that it is not surprising that this important branch of medicine has had to meet criticism and objections, and to meet them with little material or clinical data for replying to them I have used the words 'in this country advisedly, for nearly the whole of the work and most of the literature on inhalation therapy has been done and published by Continental scientists Their investigations appear to have been founded on both sound scientific research and clinical observation

If the study of inhalational therapy is to be successful here and if the methods employed for the relief of diseases more especially those of the respiratory tract, are to commend themselves to the general practitioner, it is obvious that an appeal should be made to him through the proper channel and the opportunity be given him of testing its principles by his own experiences If this method of treatment is to be of service in the only way it can be—namely, as a valuable adjunct to the medical man s armamentarium—it must fit itself to the needs of his daily practice but at the same time it must not neglect to incorporate within itself all the best results which treatment of the orthodox kind has produced or may produce Such orthodox treatment in the case of such a disability as asthma cannot be founded on any specific method for indeed no specific remedy for asthma at present exists Each case is a problem on its own whether the attacks are to be considered allergic in character, of a toxaemic nature due to vasomotor instability to a biochemical factor or to be of psychological origin etc After an experience of the past seven years in inhalational therapy I am satisfied it has, or should have, its place in physical medicine if and when combined with orthodox treatment of diseases of the respiratory tract Among other remedies I have found deep breathing, remedial exercises (expiratory type) the Dowling pack the Proetz method and especially the inhalation of carbon dioxide (7 to 10 per cent) with oxygen (to which your leading article called attention) of considerable service—I am, etc

London S W 1 Feb 1 B BURNETT HAM M D

SIR—I was pleased to see in a leading article in the *Journal* of January 23 (p 175) a reference made to the Duke Fingard inhalation treatment and was interested to read Dr Ellman s comments the following week on the value of inhalation therapy for chronic respiratory disease I am of the opinion that inhalational methods are extremely rational and worthy of fuller consideration

During the past twelve months I have observed some dozens of cases treated by the Duke Fingard method and have been impressed with the very encouraging results obtained The treatment consists in the inhalation usually while the patient sleeps of a warmed dried and medicated air, produced by an apparatus charged with a solution composed of phenol, creosote, glycerin iodine, and essential oils The room in which this is taken is rendered as

able to understand what was really meant by the words "on the evidence of physicians or otherwise" In determining the mentality of the monarch the decision would rest upon the evidence of physicians The words "or otherwise" appeared to have no meaning unless someone was intended apart from the physicians

Sir JOHN SIMON said that while he supposed the main evidence in any such case would be that of skilled professional medical men who had attended the case, it would be clear to any tribunal that wanted to gather information that this information would not necessarily be confined to physicians, nurses, or other persons having something to contribute to the evidence to be considered Mr LOGAN said there were sufficient alienists or specialists who would be able to determine what was the matter Sir JOHN SIMON said the Speaker of the House of Commons, the Lord Chief Justice of England the Lord Chancellor, and the Master of the Rolls would be among those who would have to form a conclusion

Mr MAXTON said that in any other walk of life, when a man's sanity was at issue, evidence other than that of qualified medical men would not be regarded as worthy of consideration

Mr EDE suggested that as the clause was framed there need be no evidence at all from a physician There should be provision in the Bill that physicians must at least give some evidence and that this evidence must be considered

Sir ARCHIBALD SINCLAIR said it would be a mistake to confine the evidence to specialized persons He had seen reports of criminal cases in which eminent men with great knowledge of mental disease had gone into the witness box and given diametrically opposite opinions

The clause with an amendment on another point was added to the Bill

The Bill passed through committee, and the report stage followed at once Mr LOGAN then moved to leave out the words or otherwise in the context already mentioned He said these words meant not the physicians, alienists, or men trained in medicine and experts in knowledge of the body and mind but the friends around a person Mr EDE seconded the amendment Mr LEES SMITH suggested instead of the words 'or otherwise" some such words as "satisfied on the evidence of physicians and such others" as these officials might consult

Mr MAXTON said it would not do to place the destinies of individuals merely in the hands of medical men No one should say that the medical man's dictum should be the last word even on matters of health, but the clause already met that point by having four responsible experienced laymen to survey the expert medical opinion and decide whether to propose that the King should not perform his functions but that a Regent should be put in his place Earl WINTERTON said that the clause as it stood created a possibility that the four persons might come to their conclusion without regard to medical evidence

Sir JOHN SIMON said he could conceive a case of obvious infirmity of body where elaborate expert evidence would not be required but he was prepared to agree that in another place there should be substituted for the words under discussion some such words as declare in writing that they are satisfied on evidence, which shall include that of physicians'

Mr LOGAN withdrew his amendment and the Bill passed through report and third reading

Medical Communications (Privilege) Bill

Sir ERNEST GRAHAM LITTLE moved in the House of Commons on February 5 the second reading of the Medical Practitioners Communications (Privilege) Bill which he had introduced * The Bill he said was to provide that certain communications between medical practitioners and their patients should be privileged from disclosure The protection he asked had been made more necessary in the last twenty years The Royal Commission on Venereal Disease which reported in 1916, demonstrated that energetic measures were needed to combat an alarming incidence of the disease The then Local Government Board issued regulations and a memorandum, which was published in 1916 That memorandum remained the operative measure in all hospitals and clinics in this country The Commission, in recommending the provision of adequate and skilled free treatment for all persons affected with venereal disease, said "It is important that under no circumstances must the names and addresses of patients be divulged by the medical officers" A regulation issued on the authority of the Local Government Board, and confirmed later by the Ministry of Health, said it was essential for the success of measures to deal with venereal disease that patients should be fully assured of the secrecy of the arrangements

Doctors and patients alike regarded this rule as a real protection until a doctor from one of the clinics was called on to give to a court information which he had obtained during the treatment of a patient The doctor was told by the judge that he had no privilege, and was obliged to reveal confidences made to him by the patient under those personal assurances The British Medical Association sent a deputation to the Minister of Health to urge him to see that his own regulations were carried out and that such an incident could not happen again The Minister made promises but nothing was done An even more disturbing case occurred in 1927, when the judge gave a ruling that unless the doctor gave evidence forthwith and produced the documents asked for, he would summon the whole of the hospital and all the officers concerned, and all the statements and documents in the case would be produced in court The effect of that upon a great hospital was so serious that the doctor gave way and gave his evidence under protest The ruling was

> 'The medical profession normally was under the duty of keeping inviolate the secret knowledge that they might gain from treating their patients, and, indeed, might become liable to a civil action for damages if without lawful excuse the duty of confidence was broken, but in a court of law a doctor had no privilege similar to that held by a solicitor or other legal adviser, and he was not privileged from compulsory disclosures of communications, however confidential A further point arose in the present case as to whether these doctors were in a specially privileged position owing to the fact that they were acting in a department under the control of the Ministry of Health through the local health committee In his view there was nothing in the regulations, or in any regulation he had heard of, which saved a doctor from the obligation of disclosing, if ordered to do so by the court, all the information he might have of the facts he had gained while acting under regulations"

The doctor was told that in the event of refusal he himself would suffer imprisonment A Parliamentary question was asked on the subject by Dr Vernon Davies that session, and the Minister of Health said he would give the point careful consideration The *British Medical Journal* pointed out other instances a doctor was called upon to reveal the cause of stillbirth, and gave evidence under protest The *Journal* pointed out that a doctor could be ordered to produce in court confidential entries on history cards of patients under the National Health Insurance Act, and suggested that special legislation should deal not only with venereal clinics but with other regulations under which similar questions arose

SECRECY IN THE INTEREST OF THE PATIENT

Sir Ernest reminded the House that in 1927 he had introduced a Bill in Parliament, but, on the advice of legal friends had restricted its operation to venereal diseases The present Bill without the restriction to venereal diseases, had been 'vetted' by an eminent judge, whose opinion was that its clauses were adequate to make its abuse highly improbable A consideration which justified the widening of the measure was the assurance of confidence in the case of the young unmarried mother who received ante natal treatment The highest incidence of maternal mortality occurred in the cases of these poor frightened creatures The principle of the Bill also had wide application to cases under the National Health Insurance Act Professional secrecy was in the interest not of the doctor but of the patient In this country the great body of professional opinion recommended a doctor, if he refused to

* The text of the Bill appeared in the footnote to a letter in last week's *Journal* (p 302)

a good result, as I have never seen a case cured in such a short time It therefore makes me wonder whether he is using a stronger solution than my own It is surprising that this method of treatment has not been given further consideration in this country In America the claims of success for this method of treating hernia are very high, and in some centres injection clinics for hernia have been instituted It is to be hoped that some investigation in this method of treating hernia will be raised in this country, and that this valuable line of curing ruptures will be put on a sounder basis —I am, etc,

London W 1, Jan 31 MAURICE LEE

A New View of Pneumonia

SIR,—Many years ago the old view of pneumonia as a disease of the lungs which made a man very ill gave way to the larger view that it was a grave general illness with a particularly bad effect on the lungs Then the view was taken that the most dangerous action was on the heart, and digitalisation was tried Lately the view has come into prominence that the peripheral circulation is the weak spot. I wish to emphasize the ill effect on the central nervous system in general, and particularly on the respiratory centre

It is surely not without significance that in his excellent article on the treatment of pneumonia published in the *Journal* of December 22, 1934 (p 1159) Dr Wynn chose the nervous system for his first remarks on symptomatic treatment He states that in the earliest stages—not be it observed only in the later stages—the patient shows restlessness and mental anxiety and requires nerve sedatives The marked effect on the brain of apical pneumonia which is mentioned in all text-books is only an exaggeration of what occurs in all cases The practitioner unconsciously expects his pneumonia patients to show semi-coma and delirium to an extent which he does not anticipate in other equally febrile conditions The inevitable occurrence of delirium tremens in the alcoholic subject shows the action of the pneumococcal toxin on a damaged brain Finally many doctors must have been shocked by the disastrous result of a night of sleeplessness and delirium when a sleeping draught has been omitted or been inefficient In all this there is nothing new but it does emphasize the necessity for treating the nervous system which fortunately can be done whereas no drug can benefit the inflammation in the lungs and cardiac tonics have proved useless

A really new point emerges however from a study of the respiration in this disease It is a commonplace of the text-books that from the first the pulse respiration ratio is altered—that is that the patient is breathing faster than would be expected merely from the raised temperature This might be accounted for by the pain of pleurisy were it not that, first it occurs when there is no painful pleurisy secondly that it does not cease if such pain is relieved and thirdly that it is entirely unlike the respiration seen in acute pleurisy from other causes The increased respiration cannot be accounted for by the lung condition at this early stage when physical signs are hard to find nor at this stage by cardiac weakness he only explanation left is stimulation of the respiratory entre by the pneumococcal toxin The decisive evidence in avour of this view is obtained from a consideration of the espiration immediately before and after the crisis The haracter of the breathing immediately after the crisis shows hat there is sufficient undamaged lung tissue for quiet easy spiration and as it is impossible to imagine that there has een a great change in the lung condition during the preceding ew hours this area of undamaged lung must have been vailable to the patient before the crisis but he did not use it is respirations were hurried forty or more to the minute and angerously shallow The fall of temperature might account or some decrease in the rapidity of the respiration not for ll of it and will not account for the entirely changed haracter of the breathing The explanation clearly seems to e that at the crisis the pneumococcal toxin has ceased to overdrive the respiratory centre It began to do so from the first, as we have seen it continued to do so with increasing force till either the centre was completely exhausted respiration inefficient the circulation hopelessly disorganized and death occurred or happily more often the toxin ceased to act and the centre was able to use beneficially the remaining undamaged lung tissue

The question naturally arises, Does this view of pneumonia afford us any indication for treatment? It must strongly emphasize the importance of the two things that are known to slow the respiratory rate—morphine and sleep The question of oxygen inhalation may have to be thought out afresh Indeed, it would seem that there is a call for inhalation of carbon dioxide to secure deep respiration according to the practice of the anaesthetists —I am etc,

Birmingham Feb 4 W A MARRIS M D

Silicosis and Respiratory Poisons

SIR —Dr Blacktin has been good enough to refer in his letter of January 23 to my views with regard to the micro biological aspect of atmospheric pollution Silicosis is generally regarded as a mechanical or a chemical disease, but is seldom, if ever, discussed as a microbiological one I have previously suggested that in reality it is a micro biological disease,[1] and regretted my inability to study silicosis at the present time In numerous letters I have drawn attention to the number of micro organisms in rain waters collected in rain water gauges to the fact that I find that the black on buildings is a fungoid growth and not soot, and that biological growth is responsible for a large part of geological formation other than that of an igneous nature

I believe that the characteristic feature of silicosis consists of the presence of isolated nodules of fibrous tissue. What is the composition of this fibrous tissue? Surely it is important that this should be investigated Silicosis is much more prevalent so far as I can ascertain in Africa and in hot climates than in cold ones thus among gold miners in Africa more than among coal miners in this country or in Canada

Bauxite is the end product of the decomposition of igneous rocks of sedimentary rocks, and of metamorphic rocks all of which contain on the average from 40 to 60 per cent of silica These same rocks are found in tropical and in temperate climates but in the latter the end products of decay appear to be sand (silica) the other elements being carried away in rivers whilst in hot climates the silica is the substance carried away in the water If, then, the decay of these rocks is largely a microbiological process is it not probable that silicosis is the result of the growth of the type of micro organisms which dissolve out silica, and that where other types of organisms predominate silicosis is less likely to occur? I venture to send you this thesis because I feel that it is one which should be explored but I must advise investigators that it will demand very careful technique for its solution

Now if I may be allowed one or two further comments on the letters of Drs Goodfellow and Blacktin I should like to inquire what evidence there is that coal exerts any antiseptic action at all So far as I can see coal is the end product of the type of decay caused by the cladosporium and penicillium type of organism all of which dissolve out the metallic radical but not silica therefore one would not expect silicosis to be so prevalent among coal miners This is quite a different explanation from

daughter of the late Brigadier Sir Walter Ross He had been a member of the British Medical Association since 1909 In January, 1936, he was appointed a member of the Indian Medical Council

Colonel CHARLES WILLIAM PROFEIT C S I, C M G, D S O, late R A M C died in London on February 5, aged 66 He was born at Tarland Aberdeenshire on August 23, 1870 and was educated at Aberdeen University, where he graduated M B and C M in 1893 Entering the R A M C as surgeon lieutenant on January 29, 1895, he became lieutenant colonel in the long war promotion list of March 1, 1915, colonel on December 26 1917 and retired on December 26 1923 He served throughout the South African War of 1899–1902, when he took part in the advance on Kimberley, including the actions at Belmont, Enslin, Modder River, and Magersfontein, operations in the Orange Free State, in the actions at Poplar Grove Dreifontein, Vet River and Zand River and operations in the Transvaal including the actions at Johannesburg, Diamond Hill Pretoria, and Belfast and he received the Queen's medal with six clasps and the King's medal with two clasps He also served in France and Flanders throughout the war of 1914–18, when he was mentioned in dispatches five times, in the *London Gazette* of October 19 1914 February 17 1915 January 4 and December 24, 1917 and December 30, 1918 and received the D S O in 1917, the C M G in 1918, and the C S I in 1921

Major GERALD HARTAS FITZGERALD Indian Medical Service, died at Bareilly on January 28, aged 45 He was born on September 20, 1891, was educated at Guy's and took the L M S S A in 1918 Subsequently he studied in Dublin and at Naples and in 1929 he took the D T M and H of the London Colleges He served as a surgeon probationer in the Navy in 1916 and as a temporary surgeon in the Navy in 1918-20 He had also served as assistant in the neurological department and in the ear, nose and throat department at Guy's, and as neurological specialist to the Ministry of Pensions He was appointed to the I M S as lieutenant on October 1, 1923, and became major on October 27 1932 He was serving in civil employ in the United Provinces at the time of his death

Universities and Colleges

UNIVERSITY OF OXFORD

Parliamentary Election Sir Farquhar Buzzard's Candidature

Sir Farquhar Buzzard, Bt, D M, Regius Professor of Medicine in the University and President of the British Medical Association has now issued his address to the electors as the official candidate of the University Conservative Party for the vacant seat in the House of Commons

I am neither a politician nor an expert in any branch of departmental administration' he writes, 'and I doubt whether either of these qualifications is essential for a University representative in Parliament On the other hand, I have always taken a keen interest in politics, and am prepared to give my whole hearted and loyal support to the National Government whose policy has earned both the gratitude of our own people and the respectful admiration of other countries during the last few years of unprecedented anxiety and difficulty

More than thirty years spent in the practice of my profession have brought me into close contact with the lives of some thousands of persons drawn from every rank of society and have given me an intimate acquaintance with their various social and economic problems This experience has impressed on me the importance of considering the psychological reactions of both men and women to changes in their lives and has convinced me that the State legislation however well intentioned, which fails to recognize the innate individual variations of human intelligence and of human character can never succeed in solving such perplexing questions as those which confront us in relation to distressed areas and unemployment It is impossible to exaggerate the difficulties presented by these economic disturbances, but I am of the opinion that any schemes for raising the standards of living and the material prosperity of any community must admit the existence of these human variations and give support and encouragement to personal enterprise and healthy competition among its individual members

"The National Government has recently indicated its growing interest in the physique and physical education of the people, and I am ready to welcome and support measures directed to remove the stigma, not uncommonly cast upon us of being a C3 nation This sociological problem, like many others has an important medical background, and it is essential that schemes for promoting improved standards of nutrition, better facilities for recreational exercise and more enlightened use of leisure hours should be based on sound scientific as well as sound economic principles I share the view that this question especially in regard to children is one of great importance to the future of our race, and should receive careful and expert consideration without delay

After a paragraph on international policy the address concludes with the following references to education and research

The enormous improvements which have been witnessed during the last fifty years in the general standards of living the simultaneous decrease in poverty, crime drunkenness and dirt, and the increased expectation of health and longevity are mainly due to better education and to the results of research in every field of knowledge Apart from my professional work, education and research have been my foremost academic interests, and during the last nine years I have enjoyed the great privilege of taking part in our University affairs as a member of the Hebdomadal Council and of the General Board of the Faculties, as a Curator of the University Chest and of the Bodleian Library, in addition to holding many other positions of administrative responsibility As an *ex officio* student of Christ Church and an Honorary Fellow of Magdalen I am well acquainted with the essential share which is taken by the Colleges in the endowment and organization of teaching and research in the University This experience, together with that derived from membership of the governing bodies of several important public and secondary schools, leads me to think that our older Universities preserve their great influence for good on the younger generation are steadily progressive in their outlook and in their commitments on behalf of education and research, and thoroughly deserve the special representation which they enjoy in an assembly where these subjects are reviewed in public Both subjects need skilled handling and careful control Education in particular requires wise guidance lest its primary object, that of developing a balanced critical faculty should be lost sight of amid the clamour for early specialization along vocational lines Personal knowledge of teaching and examining over many years as well as more recent acquaintance with the fundamental problems of University and school management should enable me to take a share in debate when these matters are at issue in the House of Commons"

In congregation on February 2 a proposal was approved to confer the degree of Master of Arts by decree of the House on Mr Hugh W B Cairns, F R C S, the newly appointed Nuffield Professor of Surgery and on Dr R R Macintosh, the newly appointed Nuffield Professor of Anaesthetics

UNIVERSITY OF CAMBRIDGE

The Raymond Horton-Smith prize, awarded to the candidate presenting the best thesis for the degree of Doctor of Medicine during the year 1935-6, has been awarded to Frank Goldby M D, and John Gray, M D, M Chir, who are adjudged equal

At a congregation held on February 5 the following medical degrees were conferred

M B, B CHIR—J S Minett, A D D Broughton
M B—W H C M Hamilton
B CHIR—O C Lloyd, J S Ellis, W S Nutt

UNIVERSITY OF LONDON

Appointments

At a meeting of the Senate on January 20 Mr H L Eason was reappointed representative of the University on the General Medical Council Professor C G Seligman representative of the University on the Joint Committee for Anthropological Research and Teaching, and Professor W W Jameson representative of the University at the Health Congress of the Royal Sanitary Institute to be held at Birmingham from July 12 to 17

Amendment of Regulations

It was resolved (1) that in and after 1937 the Regulations for the M S Examination, Branch I (*Red Book* 1936-7 pp 289-90 *Blue Book* September, 1936, pp 273-4) be amended to read as follows

Schools for the Physically Defective

SIR,—Dr J W Brown is reported in the *Journal* of February 6 (p 290) to have told the Royal Society of Medicine that it was a great mistake to place children with a cyanotic type of congenital heart disease in special schools with the mentally defective and backward, they should be encouraged to go to ordinary schools even if only part time

Dr Brown seems to share the all too common misconception that there is only one sort of special school, that for the mentally defective As a matter of fact the special (M D) school is only one of several different kinds of special school and the criterion for admission to it is that the child 'is feeble minded but is not incapable by reason of mental defect, of receiving benefit from instruction in a special school

On the other hand, experience of the special (physically defective) school has convinced me that such a school is the place of choice for the education of children with congenital heart lesions accompanied by cyanosis First because I think they are less likely to develop a sense of inferiority if they mix with children as severely handicapped as themselves secondly because many ordinary schools are at the top of quite high buildings and finally, because they obtain in these schools a technical training in a suitable handicraft such as tailoring or watch repairing—I am etc,

Chichester Feb 8 J L NEWMAN

B M A and T U C Joint Committee

SIR—The announcement of a joint committee being formed of representatives from the British Medical Association and the Trades Union Congress (*Supplement* February 6, p 68) is a matter for congratulation to both parties The dispute at Llanelly will have had a most happy outcome if as a result this new committee becomes what many of us believe to be not only possible but desirable The work that lies before it spreads out into the whole realm of social medicine and includes a study of the innumerable factors in economic life that underlie the attainment of a healthy community Not least of its functions will be many matters connected with industrial medicine, and in this sphere the committee will not lack willing collaborators

One important aspect must not be overlooked In the not too distant future Europe may be faced with the greatest crisis of its evolution and at the moment nothing is more important than that strong links should be formed between all progressive elements whose aim is the maintenance and improvement of community and individual health, physical and mental On the strength of those links, however small they may appear, will depend in the last resort the type of society that emerges over the next few decades The fact of medicine linking itself in a co operative undertaking with organized labour is a matter of outstanding importance This arrangement need be in no way exclusive, and must certainly not be political except in so far as politics is the consideration of means to attain agreed ends There is everything to be said for other and similar arrangements with organizations representative of educational technical and economic interests This is only the beginning of a new conception of medical statesmanship and in full realization of the difficulties that have been overcome both the British Medical Association and Trades Union Congress deserve the heartiest congratulations—I am, etc,

Beeston Notts Feb 5 LEONARD P LOCKHART

International Good Will—and Organization

SIR—I read with pleasure Dr Bryan Brown's letter and your editorial comment in the *Journal* of January 30 The dangers inherent in the present situation are weighing ever more heavily on all sections of the community and our own profession, by virtue of its great influence and exceptional international contacts, can do much to create an international sentiment which will operate powerfully in the direction of peace

But good will though vitally important is not enough, and the *organization* of a peaceful international polity is a practical issue of equal importance There must be many medical men who feel like myself the need for strengthening the League of Nations so that it may become the instrument of a broader international justice whilst offering real security against the risk of aggression The difficulties are great, and demand like the problem of cancer, courageous thought and patient research But a vigorous effort to grapple with them is already being made The New Commonwealth Society (Thorney House Smith Square Westminster, S W 1) is approaching the whole problem in a spirit of scientific inquiry, and I should like most earnestly to commend its activities to the notice of members of the profession—I am, etc,

Newcastle upon Tyne Feb 3 SYDNEY HAVELOCK

Obituary

CHARLES JAMES LEWIS M D D Sc.

Emeritus Professor of Hygiene University of Birmingham

Dr Charles James Lewis, formerly director of the public health laboratory of the University of Birmingham and professor of hygiene died in a nursing home in Birmingham on February 6 at the age of 72

After studying medicine at the University of Edinburgh and at University College Liverpool Lewis graduated M B, C M Ed with first class honours in 1885, and took the diploma of M R C S Eng in the same year He obtained the M D in 1888 the B Sc in public health in 1900, and the D Sc a year later, having been elected a Fellow of the Royal College of Physicians of Edinburgh in 1895 For some years he was in general practice in Stirling, but deafness following an attack of scarlet fever decided him to make a career in sanitary science His earlier appointments were those of lecturer in public health at the Medical College for Women at Edinburgh and the School of Medicine of the Royal Colleges In 1905 Lewis went to Birmingham as lecturer in public health and bacteriology, and soon began researches into the colon-typhoid group of micro organisms on which he published several papers and on lactose fermenting bacilli generally in relation to drinking water and uncooked vegetables His *Handbook on Public Health and Preventive Medicine* written in collaboration with the late Sir Andrew Balfour appeared in 1902 As associate professor of bacteriology and head of the department of hygiene and public health Lewis taught a large number of graduates taking the D P H course and many of his former students hold important positions as medical officers of health or as bacteriologists in hospitals and county laboratories During the war he served as bacteriologist to the 1st and 2nd Birmingham War Hospitals and did valuable work in the University when it was converted into the 1st Southern General Hospital It was in the bacteriological

QUERIES AND ANSWERS

Income Tax

Car Replacement and Bookings Basis

"AUTO" keeps two cars He sold one in 1936, for which he had originally paid £263, for £45, and bought one for £220 The total depreciation allowance given on the car sold was £80 What should he claim? He asks also whether he should agree to the "adjusted cash" basis—that is, cash received increased or decreased by the amount by which the aggregate of his January accounts exceed or are less than that of the previous year

*** (*a*) The cost of the car—that is, £263—has been covered to the extent of £45 + £80 = £125 by the sale price and the depreciation allowances, and he can therefore claim as an obsolescence allowance £263 − £125 = £138 That amount should be treated as an expense of the calendar year 1936 In addition, he can claim the usual 15 per cent (plus 10 per cent thereof) allowance for depreciation on the gross cost of the new car—that is, £220

(*b*) The adjusted cash basis is correct, but if "Auto's" gross earnings are increasing he should claim to substitute for the gross January bookings the amount of the probable cash receipts therefrom, but that claim will necessitate a detailed examination of the accounts, and as it is only the yearly differences that affect the calculation of the income it may not be worth the trouble

Deduction for Board Etc

J F' points out in connexion with our reply in the issue of January 23 (p 202) that a case somewhat similar to his own was decided against the Revenue by the General Commissioners for the Holborn Division in 1933

*** We understand that the Crown gave notice of appeal to the High Court in the case quoted and as we cannot trace any recorded decision thereon by the King's Bench Division we assume that the case did not come up for judgement and consequently that the decision in Machon v McLaughlin holds good That decision draws a distinction between a service agreement which provides £x plus board, rent, etc and one which provides £y subject to a deduction of £z for board rent etc, in the former case tax is payable on £x only but in the latter on £y, even though £y − £z may be equal to £x In our opinion J F' can obtain relief only by inducing his council to cancel the existing agreement and substitute one of the other forms

Allowance to Dependent Relative

Y Z has a brother in law who has retired sick on a pension of £156 per annum and to whom 'Y Z' makes a payment of £4 per week The inspector informs him that he cannot claim any allowance in respect of this payment, but the recipient is apparently "made to pay tax on the allowance"

*** There seems to be something wrong here The £4 a week allowance is either voluntary or paid under a binding legal disposition In the former case "Y Z" may or may not be entitled to the statutory allowance of £25 for "dependent relatives"—the degree of dependency may be open to argument—but if the allowance is paid voluntarily out of "Y Z's" taxed income the brother in law is certainly not liable to assessment on it On the other hand, if the payment is made under a binding legal arrangement, then 'Y Z' is entitled to deduct tax from it, and so gets relief at standard rate on the whole £208, the brother in law being entitled to claim repayment of the tax deducted so far as it is in excess of his personal liability

LETTERS, NOTES, ETC.

Sulphur for "Itch"

A correspondent writes from Northern Rhodesia I have found flowers of sulphur most effective in cases of intense itching caused by infestation with minute jumping insects One seems to require very fine sulphur, so that when shaken in the air, one can 'smell the sulphur" From my own personal experience, on several occasions, I am sure that the 'flowers" are most effective The only thing is that the sulphur one gets here seems to be finer than that at home, which is much more granular That bought here is supposed to be used for stock, but it is almost certainly used by the natives for making gunpowder illicitly In England the same treatment for patients has always seemed to be effective There I seldom use the ointment, but advocate the flowers or the precipitated sulphur freely Sulphur rash sometimes occurs when using the ointment but I have never known it follow the use of the "flowers" It is possible that there is a difference, in that the powder would not be so likely to penetrate the skin as would the ointment But the effect is probably due to the oxidation of the powder on the skin, and not to any absorption by the skin I suggest that those who find the ointment of little value against itch should try the fine flowers of sulphur or the precipitated sulphur

External Use of Iodine

Dr J C MACAULAY (Northampton) writes I have come to the conclusion, now that we have better antiseptics, that it is time that iodine should be practically scrapped It is caustic in its action, thereby (1) devitalizing healthy tissues and leaving them prone to after infection, (2) occluding small penetrating wounds thus helping tetanus and other anaerobes It is toxic to some people Pus formation under apparently healed (' burned out ') ringworm treated by iodine and stitch abscesses following disinfection of the skin by iodine may also be quoted I therefore think that iodine should not now be included in first-aid outfits

Physical Fitness, Exercise, and Drill

Dr D CAMPBELL WATT (Queen's Mine, S Rhodesia) in the course of a letter writes Dr Leonard P Lockhart in the *Journal* of December 5, 1936 (p 1161) and in the issue of December 19, 1936 (p 1254) and some other correspondents, stress the need for a widespread effort to improve the housing, dietary, and general hygiene of the people before tackling the problem of organized methods of physical training on a national scale It would save much valuable time if all these problems were investigated and put into practical application together In the Territorials we have a ready-made organization well adapted to promote physical fitness Their methods could easily be expanded to include a system of exercises in addition to those of a strictly military character

A Giant Kitchen

The largest capacity kitchen in Great Britain was opened in Liverpool on February 4 by Mr Geoffrey Shakespeare, Parliamentary Secretary to the Board of Education It has been erected to take the place of the six kitchens in use hitherto, and can supply 10 000 meals in an hour At the present moment it is providing 4,500 meals each dinner hour for necessitous Liverpool school children These meals are put in metal containers and taken by motor vans to twenty five meal centres throughout the city The efficiency of the containers is such that only one degree of heat is lost in transit This new all gas kitchen contains twelve boiling pans with a total capacity of 1,000 gallons, fifteen ovens, and seven steamers

Medical Notes in Parliament

The House of Commons this week considered Supplementary Estimates for the Board of Education for public education in Scotland and for other services The second reading of the Factories Bill was set down for February 11 and the second reading of the Registration of Osteopaths Bill, a private Member's measure, for February 12

The House of Lords considered the Regency Bill

The Select Committee of the House of Commons on the Medicine Duty considered a draft report

Miss Horsburgh proposes to introduce in the House of Commons next week a Bill to control the sale in Scotland of methylated spirits and of such spirits in admixtures

The Geneva Convention Bill which has passed the House of Lords was read a second time by the House of Commons on February 2 and sent to a Standing Committee Mr D R Grenfell said that in committee the Labour Opposition would move amendments to include in the Bill more direct safeguards of the rights of the Red Cross for the purpose for which it was originally intended

The Deaf Children (School Attendance) Bill was read a second time in the House of Commons on February 2 and sent to Standing Committee

The House of Commons in committee on February 4 approved a resolution authorizing expenditure by the Minister of Agriculture and Fisheries for the carrying on of scientific investigation or laboratory diagnosis as to diseases affecting fish of the salmon family or freshwater fish The Diseases of Fish Bill for the same purpose, was read a second time by the Commons on February 2

The House of Commons gave second readings on February 5 to the Wisbech Joint Hospital District Bill and the East Hertfordshire Joint Hospital District Bill

The Firearms Bill which has passed the House of Lords, was read a first time in the Commons on February 3

The Parliamentary Medical Committee has passed a resolution congratulating Sir Henry Morris Jones on receipt of the honour of knighthood

Maternity Services in Scotland

Mr Walter Elliot moved in the House of Commons on January 28 the second reading of the Maternity Services (Scotland) Bill He said the Bill was intended to deal with the problem of maternal mortality which had long preoccupied those engaged in the public health services of Scotland A report on maternal morbidity and mortality had been issued in 1935 under the auspices of a specially appointed technical subcommittee of the Advisory Committee of the Department of Health for Scotland and the Bill was designed to carry out as far as possible the recommendations of that report Its object was to improve the standard of midwifery in the home in Scotland and secure adequate nursing and medical services for women who were confined in their own homes He hoped the Bill would be found non controversial The death rate of six mothers for every 1 000 children born in Scotland indicated a greater degree of ill health which could not properly be measured but was far greater than it ought to be Some of these lives could be saved and much of the ill health could be prevented by properly co ordinated arrangements for attending to the health of the women before during and after confinement in their own homes

Scottish doctors took a larger part in confinements than English doctors and the Bill, taking account of this fact differed from the English Bill It was not limited to a midwife service but also brought in doctors and a specialist service Every expectant mother who desired to be confined in her own home would be entitled to the services of a midwife and doctor and if necessary the doctor would be at liberty to call for the advice or help of an obstetrician of recognized standing When a suitable period had elapsed after the confinement the doctor would visit the mother to advise her as to any treatment she might need This post natal examination aimed at preventing the development or continuance of conditions that might give rise to ill health in later life The midwife the doctor and the specialist would work together as a team under the general administration and oversight of the medical officer of health whose advice would be available to doctor and patient if difficulty arose The co operation between doctor and midwife on which the scheme was founded arose naturally out of existing conditions in Scotland but experience might make it desirable later to modify the arrangements The Scottish practice was for the confinement to be attended by a doctor and the Government thought it right at any rate in the initial stages that general practitioners should be given a chance to show that the confidence placed in them was justifiable The Government hoped that with the midwife service and the advice of specialists at call the doctor would not be required to go beyond minor assistance

Local Authorities and Midwives

The arrangements which the local authorities would be required to make would be subject to the approval of the Department of Health The local authorities had complained that they were being put under the control of the Department of Health That was not so These provisions were inserted in the Bill to ensure that the Department the Minister and through the Minister the House of Commons could keep an eye on the working of the scheme The local authorities would have elasticity in making their arrangements and the difficulties which certain areas had with communications would be taken into account It would be open to local authorities to negotiate with the voluntary associations employing midwives or to arrange with midwives engaged on private work, or themselves to establish a salaried service of midwives Before submitting proposals to the Department of Health local authorities were required to consult the voluntary associations which employed or were willing to employ midwives in their areas and also to consult with any organization which spoke for the midwives practising in an area The remuneration of midwives was a point which would arise for discussion in committee When the scheme came into operation the handywoman would disappear from Scotland

The number of midwives in practice would be reduced by operation of provisions for compensation on retirement Midwives engaged by the local authorities would be paid by those authorities or by their own associations and would no longer have the not uncommon experience of rendering services for which they received no fee The Bill provided that if a midwife gave up a certificate within three years after the Bill had passed she would receive as compensation three years average income In cases where midwives remained in practice after they had become unfit local authorities were empowered to call upon these midwives to surrender their certificate subject to a right of appeal to the Department Such midwives would receive five times their average income calculated on the previous three years

Local authorities would be free to select their own methods for securing medical services so long as those services were adequate In some areas the local arrangement would be with all medical practitioners who were willing to undertake the service In other areas the ante natal and post natal examinations might be carried out at the authorities clinics and arrangements might be made with all the practitioners or with a limited number Arrangements would ensure that the doctor attending the confinement was advised of the results of the examination which had been carried out before The service offered to expectant mothers was not compulsory but the Department expected that it would be generally taken advantage of

Patient's Fees and Payments to Doctors

Fees would be graded according to the ability of the patient to pay and none would be charged in the case of the necessitous mother For insured women the wives of insured

stating that there is no certain method of cure in these complications advocates the use of sympatol rather than adrenaline It gives increased tone raising the blood pressure slowly but for a prolonged period, and increasing the volume of the heart beat The circulation in the coronary and cerebral vessels is improved The drug can be given by mouth Injections of all kinds should be avoided as far as possible in diphtheritic patients, since the excitement they produce may be very harmful Glucose is of value in treatment, but has the disadvantage of having to be administered intravenously Copious fluids should be given Hypnotics may be required

Surgery

119 Benign Mammary Tumours in Males

E EGUES (*Sem med* B Aires, November 26, 1936, p 1469) records three illustrative cases in males aged 16, 34, and 29 of benign tumours of the mammary gland In two of the cases histological examination showed that the tumour was a pericanalicular fibroma, while in the third there was an excessive development of the connective tissue forming a mammary fibroma In two of the cases there was a history of trauma preceding the development of the growth All made a good recovery after amputation of the breast, and no recurrence took place Of 270 benign and malignant cases of mammary tumour admitted to the Institute of Clinical Surgery at Buenos Aires from 1919 to 1935 only three (1 11 per cent) were in males According to Gutierrez and Monserrat 78 8 per cent of mammary tumours are malignant and 21 2 per cent benign

120 Nephropexy

Professor MARION (*Rev med franç*, December, 1936, p 781) describes nephropexy as an operation which has become increasingly popular as the technique has improved For the procedure to be successful the kidney must be fixed securely in a high position Failures in the past have been due to faulty technique The operation is recommended for those patients with pain, dilatation of the pelvis of the kidney, and chronic infection or haemorrhage for which medical treatment has been unsuccessful Pyelography should be carried out before operation The technique of the procedure, which is based on that of Surraco, is fully described and illustrated It consists of the exteriorization of the displaced kidney, examination of the junction of the pelvis and the ureter, fixation of the kidney by means of linen sutures passed round the twelfth rib, formation of a sling composed of renal capsule to support the kidney, and drainage and closure of the wound If displacement is bilateral intervention may be carried out on both sides during the same operation The patient should remain in bed for three weeks so that sound healing may take place

Therapeutics

121 Dangers of Dinitrophenol

H F WHALMAN (*Amer J Ophthal* October, 1936, p 885) examines the original investigations in 1935 of the ill effects produced by the use of alpha dinitrophenol as an agent for reducing weight He recalls that no ill effects from the use of alpha dinitrophenol as a weight-reducing agent were reported until 1935, when the development of cataract was observed in some cases The majority of patients were between 25 and 45, and the duration of treatment had lasted from one to eighteen months the dosage being inside the recommended limits There was a rapid reduction of vision to perception of light in seven days to six months coming on during and up to three months after treatment Changes in the anterior capsule and cortex and polychromatic lustre were followed by marked swelling and almost complete disintegration of the lens There was an increased aqueous flare, but the vitreous was unchanged An increase in intraocular pressure was frequent, but the visual results were good after extraction of the cataract About ninety cases in all have come to the author's notice

122 Artificial Feeding with Human Milk

P FELDWEG (*Disch med Wschr* December 11, 1936 p 2054) claims that propaganda in favour of breast feeding is largely responsible for the decline of infant mortality in Germany during the past fifty years from 40 to 7 per cent He believes that the latter figure could be further reduced by about half if an educational campaign were undertaken to promote the feeding of infants with human milk He calculates that in spite of the greatest care being taken some 15 to 20 per cent of all mothers cannot provide enough milk for their infants There are other infants whose mothers cannot feed them adequately or at all for economic reasons To meet these difficulties the author advocates the provision of a centre for collecting and distributing human milk, and he notes that six such centres are already at work in Germany The author's own experiences deal with one of these centres started in July, 1935 and run in association with a maternity hospital Most of the suppliers of this milk are mothers who have been confined in this hospital, and it has been found that when care is exercised in the technique of breast feeding, and the breasts are pumped empty every day after feeds, about 60 per cent of all the mothers can be made to provide more milk than their own infants require After pumping the human milk is collected, and if it proves to be sour it is discarded The simplest test for distinguishing between human and other kinds of milk is to submit a sample to a high-altitude light, under which the milk appears violet if it is human, whereas it is yellow if derived some other source The human milk is sterilized by and though this procedure has been criticized the author experience with thousands of infants reared on human milk thus sterilized has convinced him that they react as satisfactorily as do infants who are directly breast fed, and he finds that heating is a more satisfactory less expensive precautionary measure than is the freezing of milk

123 Inoculation against Typhus

G BLANC (*Brit med* November 22, 1936 p 116) records his observations on 23 673 persons of all ages and both sexes in Morocco who have been inoculated with a vaccine prepared as follows A guinea-pig infected with murine typhus was killed during the eruptive period when it had a well-marked inflammation of the tunica vaginalis The spleen, suprarenals, and tunica vaginalis were ground up into a pulp which was diluted in two litres of normal saline and filtered 5 c cm of sterilized ox bile was then added to 95 c cm of the dilution, and after the mixture had stood for a quarter of an hour it was injected into the deltoid in doses of 1 c cm for adults 1/2 c cm for children between 8 and 15, and 1/4 c cm for those from 1 to 8 years The results of the method were as follows (1) The outbreaks of typhus in various parts of Morocco were rapidly brought to an end without the use of any other prophylactic measure (2) Apart from a few cases of typhus which occurred during the first three weeks after inoculation among persons who had been infected at the time of inoculation or among those who had acquired a late and incomplete immunity vaccinal reactions were very slight None occurred among Europeans and among the native population they were uncommon and very mild

Almost all the provisions of the Bill dealt with intra natal measures That was too late The nutrition of the expectant mother was one of the most important helps to her successful confinement Investigation of mortality from maternity acci dents in the Island of Lewis showed the mortality there was lower than in Paddington The reasons suggested were that the fresh milk and food in Lewis made all the difference to maternal mortality That aspect of the question was universally accepted In the ante natal period there were diseases and physical disabilities which only the medical man could discover Such conditions could not be made clear unless care was taken in investigation of cases before confinement To give the mother who was the victim of venereal disease any prospect of a healthy child and a normal confinement treatment must take place quite early and if given throughout there was every prospect of the birth of a healthy child as was proved by statistics

The report on Maternal Morbidity and Mortality in Scot land recommended the provision of more maternity beds, but this did not seem to be touched upon in the Bill Mortality in well conducted and scientifically administered maternity homes had been much lower than in confinements in the best circumstances at the homes of patients Queen Charlotte s Hospital had conducted in the past year observations into the prospects of mitigating the mortality from puerperal fever During that twelve months a new drug had been tried and the mortality decreased from 22 per cent to 2 per cent That kind of experiment could only be tried in well equipped maternity institutions He deprecated the fact that the Bill rather left the general medical practitioner out of the scheme A year or two ago the General Medical Council sent to universities which were principally responsible for the training of medical men a circular upon the importance of increasing opportunity for obtaining practical skill in London and else where Elaborate changes had been suggested and some had been made in the medical curriculum to meet that need If the sphere of activity of the general practitioner was diminished the urge for improvement in his education would decrease. The Scottish report indicated dangers from measures taken at the confinement itself by a relatively ill equipped midwife Nothing was more dangerous than to do too much at a confinement Ante natal care lessened the need to inter fere He would rather spend more money upon measures for the preparation and the preceding stages than on the actual delivery, which ought to be a normal process From that point of view the Bill would disappoint the medical profession

Mr GUY said Sir Ernest Graham Little did not give full credit to the place which the Scottish Bill ensured the medical practitioner in confinements It was discreditable that no less than 60 per cent of the cases of maternal mortality were in the opinion of the authors of the Scottish report avoidable In some cases the fault rested with the patient but in the larger proportion there had been some carelessness or faulty diagnosis perhaps some negligence on the part of the midwife or attendant or of the medical practitioner Maternal mortality would in due course considerably diminish because a proper scheme was to be elaborated for training nurses and perhaps also medical practitioners

Mr BUCHANAN thought the inclusion of a scale of fees to be charged to mothers according to their means might prevent the Bill from achieving its object The poorest people were chargeable on the Poor Law and the Poor Law doctor had to attend them when they needed a doctor The very poor woman was usually sent to a first class institution and received the best medical skill In the case of people with incomes of about £3 10s a week the doctor was usually a very human man and did not wish to run up an excessive bill He therefore attended only when absolutely compelled to do so and the result was that the woman drifted on If an insured man was ill he was sure of free medical attention and hospital treatment Why not extend the same facilities to the wife and child of the insured man?

REPLY TO THE DEBATE

Mr T M COOPER (the Lord Advocate) replying to the debate said that the Bill was not concerned with institutional treatment because that was covered by other measures and the Scottish Department of Health did not overlook the advan tages which could be secured from better nutrition for the expectant and the nursing mother The Bill must be judged for the limited purpose with which it was concerned This was provision of adequate domiciliary nursing service It was not intended that Clause 1 Subsection 9 should render inopera tive the safeguards of earlier subsections The proposal was that if under Subsection 9 revised schemes were put into operation there should again be consultation with medical practitioners or voluntary organizations Several members had asked about the length of the lying in period The Bill defined this as the period provided by any rule for the time being in force under Section 5 of the Midwives (Scotland) Act At present the period was ten days but if the autho rities under the Midwives Act increased it to fourteen days that would be the period for the Bill

The proposal to compensate with three years net earnings the midwives who voluntarily relinquished their certificates and with five years net earnings those who were compelled to do so was similar to the principle adopted in the English Bill The members for the Scottish Universities justly apprehended a risk that schemes under this Bill might operate to the detri ment of the teaching of midwifery to the doctor and midwife The previous draft of the Bill introduced last summer made no provision for such facilities but in the present text Clause 1 (8) provided for the maintenance of facilities If the language of that provision was inadequate Mr Elliot and he would be glad to examine any formula They must adapt their legislative and administrative arrangements to ensure the continuous supply of competent trained midwives and doctors

With regard to the clause which imposed a penalty on un qualified persons who for remuneration attended as nurses on women during ten days immediately after childbirth he had been asked why the Government proposed to exempt from the penalty categories of persons who were set out in Clause 6 (1 *b*) The answer was that all these persons were in some recognized and responsible institution where medical assistance of a highly qualified character was readily available He was willing to listen with an open mind to any arguments directed to that point He thought that refresher courses might be brought within the schemes approved under Clau e 1 in which case they would rank for grant he was prepared to consult with Mr Leonard on that matter He did not think that it would be advantageous to make the new maternity service purely gratuitous as Mr Buchanan had urged He assured Sir Ernest Graham Little that there was no ground for fearing that the whole endeavours of the central Department and the local authorities would not be bent upon dealing with the ante natal period which was probably the most crucial time

The Bill was then read a second time without a division and committed to Standing Committee The accompanying resolution authorizing the payment of moneys provided by Parliament to finance the proposals of the Bill was carried through Committee of the whole House without discussion

In the House of Commons on February 1 the money resolu tion for the Maternity Services (Scotland) Bill was agreed to on the report stage

Sir Ernest Graham Little has been added to the Standing Committee which will consider the Maternity Services (Scotland) Bill

Factories Bill

In the House of Commons on January 20 Sir JOHN SIMON presented the Factories Bill which is to consolidate with amendments the Factory and Workshop Acts 1901 to 1929 and other enactments relating to factories The Bill is not only a consolidating measure it is a revising measure which will bring the provisions of the Factory Acts up to date The main changes proposed in the Bill are as follows

The various distinctions which exist in the present law between factories and workshops and between textile and non textile factories are abolished and only one term— factories" —is employed

but its development is more rapid, it is softer, and it is accompanied by pain For sarcoma operative treatment is necessary and should be carried out as early as possible In certain cases sarcomatous degeneration may take place in a fibroma and is an indication for immediate surgical removal Submucous polypi are of a fibrous nature and pedunculated inside the uterine cavity In these cases a simple polypectomy by the vaginal route will usually be sufficient Endometriomata or nodular adenomyomata are hard to distinguish from fibromata and are often only recognized at the time of operation or as a result of biopsy In cases where the "fibroma" is small with marked dysmenorrhoea the possibility of adenomyoma must be borne in mind These tumours are benign In cases of diffuse endometrioma or adenomyoma, hysterectomy is the safest procedure, as the patient is usually near the menopause and may suffer from anaemia due to prolonged haemorrhage Correct diagnosis should be made wherever possible so that cases may be divided into those which can be treated by simple irradiation, curettage, local removal, or hysterectomy After the menopause radical treatment is advised

129 Indications for Forceps

F v MIKULICZ-RADECKI (*Munch med Wschr*, November 27, 1936, p 1953) contrasts favourably the conservatism of German midwifery, with 1 25 to 8 3 per cent of forceps applications, with transatlantic statistics which give corresponding percentages up to 80 He thinks, nevertheless, that the general practitioner is inclined too lightly to apply forceps for uterine inertia ("poor pains labour not progressing") Such an indication, according to midwives' records in East Prussia, was the reason given for 1,022, or 60 per cent, of 1,563 forceps applications in 1932–4 at the same time, in the local lying-in hospital the percentage of interventions for this cause was only 13 Uterine inertia is preferably treated by morphine and small intramuscular or subcutaneous injections of pituitary extract it is only to be regarded as calling for forceps application when this is justified by other conditions and when in addition (1) pyrexia above 102° F is present, (2) the head does not advance (in spite of completely dilated os cephalic engagement, and already ruptured membranes) during a wait of two hours, or (3) the head, visible during each pain, does not advance during one hour In the clinic nearly two-thirds, but in general practice only 6 per cent, of forceps operations were done because of impairment of activity of the foetal heart it has been found at Konigsberg that acceleration of labour is called for when in three consecutive pauses between pains the frequency of the foetal heart remains below 100 a minute In further criticism v Mikulicz-Radecki suggests that the practitioner might more often find an indication for forceps in maternal heart, lung, or kidney disease, and should more frequently do episiotomy in conjunction with use of forceps (The preservation of an intact cutaneous perineum is often only accomplished at the expense of tearing of the perineal muscles, leading later to prolapse) The following general rules are laid down concerning the conditions in which forceps application is or is not justified and indicated (1) Forceps application is impossible, and therefore contraindicated, when the head is movable above the pelvic brim (2) If a portion of the head, but not the whole of its greatest circumference, has entered the pelvis a forceps operation would be a 'high forceps' in the strict sense of the word is best avoided altogether in external practice, but is occasionally justified when done with the greatest care in multiparae or after prophylactic vagino perineal incision as a means of saving the life of the child It must always be remembered that the only possible sequel to such an attempt if it fails, is perforation (3) If the whole of the greatest circumference of the head has entered the brim ('high forceps' in the broader sense) forceps application although difficult, is justified on urgent maternal or foetal indications (4) If the greatest circumference of the head is in the mid-pelvic zone forceps application is permissible but may be difficult (5) Instrumental delivery of the head lying at the pelvic outlet is easy except when contraction is there present as in funnel shaped pelvis The degree of engagement of the head in the pelvis is determined by vaginal examination If the lowest point of the head is not more than a fingerbreadth above, or has passed the interspinal line, it is clear that the greatest circumference of the head has reached or passed the pelvic brim, but in making the reckoning a caput succedaneum must be distinguished, by careful search for fontanelles or sutures, from the true skull In addition to the foeto-pelvic relations the following conditions must be ascertained before forceps application the membranes must have ruptured, the foetus must be alive, and the os must be fully dilated Before this is attained, in the foetal interest to try forceps application—a frequent cause of "failed forceps"—is culpable self deception better exercise patience, use belladonna suppositories, or even try careful manual dilatation Very rarely, when a remnant of cervix remains, constituting a ring of not more than one fingerbreadth, the experienced accoucheur for the most urgent reasons may be impelled in these conditions to apply forceps after making left and right radial antero-lateral incisions of the cervix

Pathology

130 Blood Platelets in Artificial Pneumothorax

I HIMMEL and J STOPCZYK (*Tuberculosis* Warszw, No 4, 1936, p 380) found that the number of blood platelets in cases of artificial pneumothorax ranged between 120,000 and 250,000 independently of the intensity, extent, and progress of pulmonary tuberculosis The establishment or maintenance of pneumothorax increased the quantity of platelets and it was exceptional for their number to remain stationary The variations in their number did not correspond with the changes in the other morphological elements of the blood, and were independent of the quantity of gas introduced into the pleural cavity and the degree of pulmonary compression In the course of pneumothorax treatment the thrombocytic reaction diminished until it finally disappeared Two periods could be distinguished in the therapeutic action of artificial pneumothorax according to behaviour of the platelets the first consisting in a general reaction with an increase in the number of the platelets, and the second being mainly one of mechanical action

131 Sedimentation Rate in Scarlet Fever

J S COOKSON (*Brit J Child Dis*, October–December, 1936, p 251) records his observations on seventy six cases of scarlet fever in which the erythrocyte sedimentation rate (E S R) was determined at various stages of the disease Forty-seven were females aged from 4 to 30 and twenty-nine males aged from 3 to 30 Thirty four were given scarlet fever antitoxin The technique employed was the modification of Westergren's method recommended by the Association of Clinical Pathologists Cookson's conclusions are as follows (1) The E S R is a simple and sensitive index of the progress of a case of scarlet fever (2) A considerably raised E S R on the fourteenth day of disease means either that complications have already developed or will do so (3) The E S R is useful in differentiating the types of albuminuria in scarlet fever A high rate indicates acute nephritis whose progress is worse than that of the benign types (4) All the complications of scarlet fever except benign albuminuria and serum reactions cause a rise of the E S R (5) There is no definite relationship between the E S R and the other blood changes (leucocytosis and eosinophilia) in scarlet fever (6) The E S R is a useful index of the efficacy of treatment

was manifest in school children but the position was far from satisfactory He quoted from the report of the Chief Medical Officer for the Board of Education for 1935 which declared that in some areas severe depression continued for many years and left its mark In Durham County several teachers declared that many of the children were thin and were much below the standard of five years ago in physique mental alertness and ability and were decidedly backward in lessons and easily tired One head master stated that in his own school of 400 children one third showed the need for more food and many showed signs of distress in spite of the milk ration Undernourishment was not confined to the special areas Mr Shinwell cited the results of tests on children in Scotland and submitted the general proposition that improvement manifested itself when more and better food was regularly supplied

COST OF FREE MEALS

The Ministry of Education has issued a new circular affirming two conditions before meals could be provided One was that the incomes of parents must not go beyond a certain scale The other condition irrespective of the income was that it must be firmly established by medical inspection that the child was unable by its physical condition to absorb education If it was necessary to impose conditions he would rather have the income condition than the other Mr Shinwell suggested that the Minister's estimate of 24 million pounds as the cost of providing a free meal to all school children was an exaggeration "Even if that were the cost the reduction in disease consequent on the provision of the right nourishment would far outweigh it Sir Francis Fremantle had stated in the House that the annual cost of disease to the nation was 300 million pounds

Mr JAMES BROWN seconded the motion

Miss CAZALET moved to substitute for Mr Shinwell's motion the following words

> That this House welcomes the measures taken by the Government to promote the physical welfare of children, recognizes the beneficial results already achieved as shown by the annual reports of the Chief Medical Officer of the Board of Education and hopes that where necessary the powers already possessed by local education authorities for the purpose will be more fully utilized

She said that nearly 3 000 000 children were already benefiting under the milk in schools scheme and nearly 400 000 were receiving free milk daily She did not agree that the facts in relation to London were not satisfactory There was not in London a single child whose education need suffer because of undernourishment or malnutrition She believed that to be the case also in many parts of the country

MALNUTRITION OR UNDERNOURISHMENT

Mr KEELING said it was true that more than half of the school children of the country did not avail themselves of the scheme for cheap or free milk but the main cause of that was not poverty but the indifference of the parents or the distaste of the child He suggested that the Government should make more frequent surveys of the nutrition of children Medical officers had said that was necessary Some alteration of the routine medical inspection in schools was required The income scale which qualified parents to get free meals for their children was in some cases still high In some very poor areas no solid meals were given but only milk Something should also be done to improve the quality of the meals where they were badly reported upon Sir FRANCIS ACLAND said the primary problem was not one of undernutrition but of malnutrition arising from poverty Sir Robert McCarrison had said that an examination of the youngest group of children attending elementary schools under the London County Council revealed among 1 635 unselected 5 year old children the presence of one or more abnormalities in 87 per cent These defects were in the main defects of malnutrition rather than of undernutrition Mr LOVAT FRASER said milk did not suit everybody and some children refused to take it All children took far too much tea An inquiry conducted by the Hannah Dairy Research Institute of Ayr among 13 317 children showed that 7,017 did not drink milk at all and 4 323 took it only once a day Only 5 per cent of the children failed to take tea at least once and 50 per cent took it three or more times in the day Over ninety children took tea five times daily and one third of these were under 10 years of age

GOVERNMENT REPLY

Mr GEOFFREY SHAKESPEARE said Mr Shinwell had made a fair statement but had slipped up in quoting some London figures There was unanimity among school medical officers on the fact that there was no general deterioration in health in spite of the strain of economic circumstances The Board of Education in partnership with the local authorities gave increased attention in the routine inspection to the state of nutrition and to the assessment of that state by the doctor on more careful and uniform lines The practice was also growing of arranging nutritional surveys at short periods In 1924–5 132 local education authorities provided for 70 000 children 7 500 000 free meals (including free milk) In 1935–6 235 local education authorities provided 479 000 children with 86 500 000 free meals Circular 1443 of December 1935 laid down that this free nourishment should be provided if the children showed the slightest symptom of inability through lack of food to profit by their education Teachers and others who were in constant touch with the children could make recommendations on this basis

The milk in schools scheme had provided for 2 500 000 children The account of Dr Petrie in the Chief Medical Officer's report showed how widely this scheme benefited the children The Board of Education would like to see many more children enjoy its benefits and last year sent an investigator to find why no more than 50 per cent of the children took this free milk He reported that poverty was not an important reason for non participation by the other 50 per cent In areas where there was poverty participation was higher Non participation was due either to indifference on the part of the parents or more usually to a distaste on the part of the children Until there was more publicity about the value of milk a number of children would not take advantage of the facilities The Board of Education encouraged the provision of school canteens and in the reorganization of the education services which was going on the senior schools as a rule had canteens at which the children could get a good dinner at a reasonable charge

In the report of the Chief Medical Officer of Health a nutritional survey was given which showed that out of 1 687 000 children examined in England and Wales in 1935 14·6 per cent were found to be excellent 74·1 per cent were normal 10·6 per cent were slightly subnormal and 0·7 per cent were bad In London out of 189 200 children 0·08 per cent were bad 10 646 or 5·67 per cent were slightly subnormal and the rest were satisfactory When a child was slightly subnormal the cause might be bad housing or lack of sleep or it might be functional or the result of disease In the experiments recently conducted at Aldershot on the substandard recruit the doctor in charge said good nutrition and intensive physical training were factors in the improvement but the regular hours of routine to which the recruits were subjected was a factor no less important

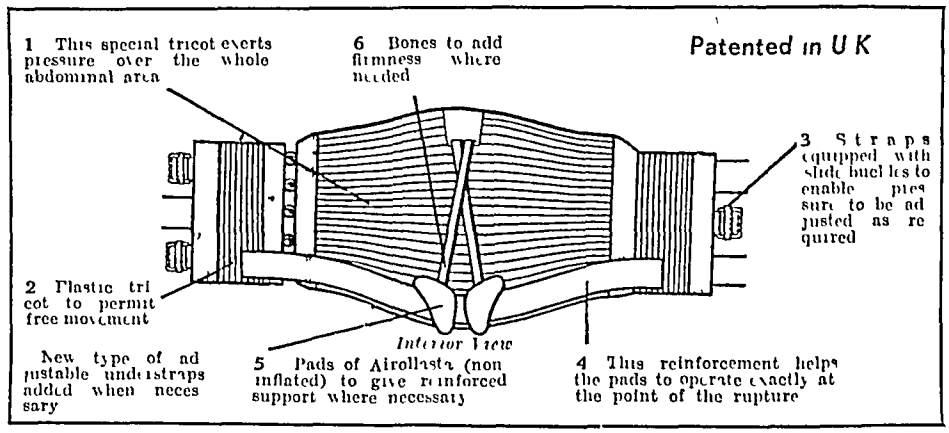
The Ministry did not consider the present state of affairs satisfactory, and was in touch with local authorities to ensure that their income scales did not prevent children getting extra nourishment who really needed it It was pressing on local authorities the importance of more frequent nutrition surveys and hoped to send all local education authorities a pamphlet showing how beneficial a system of dinners at canteens could be

On a division Mr Shinwell's motion was defeated by 178 to 126 and the House subsequently adopted Miss Cazalet's amendment by 167 to 124

Regency Bill Question of Incapacity

The Regency Bill was considered by the House of Commons in committee on February 4 On Clause 2 (Regency during total incapacity of the Sovereign) Mr LOGAN said he was not

Entirely New Hernia Treatment



THE RIGIFLEX BELT

The medical profession has received the Rigiflex Belt so favourably, that we feel justly able to claim that we are helping to revolutionise the treatment of Hernia

The Rigiflex Belt is submitted after careful experiment and frequent examination by members of the medical profession

Structure of the Rigiflex Belt

The non-elastic tricot front, and elastic tricot at back, are designed to ensure correct pressure of the whole of the belt over the whole of the abdomen and to lift the organs away from the Hernia area Over the Hernia area, the Rigiflex Belt is reinforced to exert powerful pressure Airollasta pads are attached to belt where and when needed The three slide buckles ensure perfect adjustment and "pull" for individual requirements

We would appreciate your inspection

We would greatly value your personal inspection of the Rigiflex Belt, and we should be glad to send you a specimen free of charge for your inspection We feel that you will agree that such a revolutionary treatment of Hernia merits your closer notice May we send you a copy of the Rigiflex Booklet No F5?

THE RIGIFLEX BELT

is on Sale Only at

Rigiflex Belt Co, 173, Regent Street, London, W.1 Telephone Regent 7570

City Branch 43, Cheapside, E C 2 Also at Manchester, Liverpool, Birmingham, Bournemouth, Bristol, Glasgow and Edinburgh *(See Telephone Directories for full addresses)*

give evidence in court to base his refusal on medical privilege and to submit to imprisonment if forced to accept that course In that way the law might be altered but amendment by ordinary Parliamentary procedure was preferable

Mr J A LOVAT FRASER seconded the Bill

REJECTION MOVED

Mr DINGLE FOOT moving the rejection of the Bill said its sponsors failed to appreciate what the consequences would be if the Bill passed into law Neither the mover nor the seconder had explained whether the privilege which the Bill proposed would be the privilege of the doctor or of the patient If a man wanted to call his doctor to give evidence on his behalf the doctor might be able to refuse or even be prevented under the terms of the Bill from giving evidence When a man was knocked down by a motor car the insurance company would send its own doctor to examine him but that examination would not be for the purpose of treatment or the purpose of cure and therefore the insurance company's doctor could give evidence but the plaintiff would not be able to rely upon his own doctor even to prove the injuries he received

Sir JOHN WITHERS remarked that this argument would fall to the ground if it was made clear that the privilege was to be the privilege of the patient

Mr ERNEST EVANS in seconding the motion for rejection said members of the medical profession were claiming a privilege for themselves not for the general public The Bill would impose on the medical profession a responsibility which few of them would wish to have

Sir JOHN WITHERS said the same proviso would apply as in the case of solicitors—that if privilege were claimed the court would decide whether it was a case for privilege He had great sympathy with the doctors and was sure that if the Bill went to committee the question whether the privilege was of the doctor or of the patient could be cleared up

LEGAL VIEW OF THE BILL

Sir TERENCE O'CONNOR recommended the House to refuse a second reading Cases were few in which the law did not insist that the whole truth should be presented in a court of law These cases were strictly confined to communications between husband and wife, to evidence of judges and jurymen on matters which had taken place while they acted judicially to State secrets, and to a few matters on which decency forbade disclosure The only other case which bore any similarity to that put forward by Sir E Graham Little concerned communications between a client and the legal advisers he had called in for the purpose of obtaining justice in a court of law That was the privilege of the client and not of the solicitor To put any of these classes of privilege into statutory form would be difficult In the Bill there was no definition of what was the privilege Sir Terence inclined to think that as the Bill was drawn the privilege was that of the doctor He did not know if the doctor could waive his own privilege when a dying man had told him the name of his assailant or when a young woman patient disclosed to him the name of an abortionist a case more common Workmen's compensation cases and many other cases came to mind There was hardly any breach of the law, civil or criminal in which the passage of this Bill in anything like its present form would not impede the administration of justice He could hold out no hope that alteration of the Bill would make it workable Why should the new statutory privilege be confined to doctors? With every sympathy with the intentions of the Bill especially in regard to venereal disease he could not advise the House to accept it

Mr H. G WILLIAMS said the first words of the Bill would give a medical practitioner free discretion whether he disclosed the facts to the court or not That was a position into which no witness ought to be put What would be the state of our law if every medical witness were in a position to tell as much of the truth as he thought desirable? It would make the medical evidence irrelevant, because the court would not know how much of it was important evidence and how much unimportant

The motion for the second reading of the Bill was then negatived without a division

Experiments on Animals—Mr GEOFFREY LLOYD in an answer on January 27 to Mr Duncan Sandys said the Cruelty to Animals Act 1876 provided that experiments might be performed without anaesthetics on a certificate called Certificate A being given that insensibility could not be produced without necessarily frustrating the object of such experiments Before the Home Secretary allowed any such certificate to come into operation he always attached to the licence a condition whereby no operative procedure more severe than simple inoculation or superficial venesection might be adopted in any of the experiments enumerated in the certificate Severe surgical experiments involving cutting operations were never allowed without anaesthetics

Extension of National Health Insurance—Preparation of the scheme for the insurance of black coated workers has reached an advanced stage but the Government cannot say when the Bill will be introduced

Notes in Brief

Out of ninety eight applications for certificates that death had been caused by silicosis received by the medical board under the various industries silicosis schemes among coal miners in South Wales in the year ended December 31 1936 sixty three were granted, sixty of the applications related to anthracite miners and thirty nine were granted

Sir John Simon can hold out no prospect of earlier publication of the annual report of the Factory Department of the Home Office

With the aid of the £1 000 000 grant under the Rural Water Supplies Act 1934 schemes have been undertaken for the supply of 2 250 parishes with water at a total cost of over £7,100 000 About one third of the schemes have been carried out and work on the remainder will be complete by the end of 1938

The approximate number of beneficiaries of the Ministry of Pensions on December 31 1936 was 943 000 a reduction of about 32,000 on the figures for the previous year

The Services

DEATHS IN THE SERVICES

Colonel HAROLD HAY THORBURN C I E I M S died at Peshawar on January 27 aged 54 He was born on December 1, 1882 the second son of Mr J Hay Thorburn and was educated at Edinburgh Academy and Edinburgh University where he graduated M B Ch B in 1906 Entering the I M S as lieutenant on September 1 1906 he got a brevet colonelcy on July 1 1931 and became full colonel on March 4 1936 His first five years of service were spent on the North West Frontier in the Malakand the Khyber and Waziristan after which he was posted to Meshed as agency surgeon then under the Consul General and Agent to the Governor General in Khorasan He was holding this post when the war began in 1914 and then raised the Hazara Levy which he commanded for two years In 1916 he went to Seistan to join the South Persian Rifles under Sir Percy Sykes After the war he was appointed civil surgeon of Quetta and chief medical officer in Baluchistan From 1924 to 1927 he was surgeon to the Legation at Kabul under Sir Francis Humphreys King Amanullah gave him the Afghan Order of the Wafa In 1933 he went to Ajmer as chief medical officer of Rajputana While there a Hindu lunatic tried to assassinate him but Thorburn disarmed and captured the assailant and handed him over to the police On promotion to colonel he was appointed inspector general of hospitals in North West Frontier Province He received the C I E in June 1917 and was appointed honorary surgeon to the Viceroy Lord Irwin in 1927 Last year he married Diana,

IN CASES OF CHEST COLD, BRONCHITIS, ASTHMA, WHOOPING COUGH, SPASMODIC CROUP, and similar respiratory affections, Vapo-Cresolene brings relief The germicidal vapour clears air passages and soothes paroxysms Used at night during sleep, it helps the patient to obtain undisturbed rest Vapo-Cresolene is specially prepared from creosoles of coal tar and has a reputation of 57 years standing It is invaluable for the treatment of children Laboratory tests, by a research laboratory of unquestioned standing, show that the vapours produced from Vapo-Cresolene by the Cresolene Vapours exert a direct germicidal action when in contact with moist surfaces harbouring pathogenic bacteria associated with respiratory affections

Branch I—Surgery

Every candidate for the Degree of Master of Surgery Branch I must have taken the Degrees of Bachelor of Medicine and Bachelor of Surgery in this University not less than two years previously

Every candidate must forward together with his entry form

(i) A certificate of having held for at least two years subsequently to obtaining the M B B S degrees in this University an approved surgical appointment or appointments at a hospital with an associated medical school recognized for this purpose

(ii) A record of operations performed by him signed by the surgeon or surgeons under whom he has worked

Details of Examination

The examination will consist of

Two papers in Surgery (one of which may be a case for commentary)

An essay on one of two subjects which may be selected from any branch of Surgery

Two papers in Surgical Pathology and Surgical Anatomy

A clinical examination

An examination in methods of surgical approach and the conduct of operations

An oral examination

(2) That during the years 1937 and 1938 candidates for the M S Examination (Branch I) who are unable to comply with the new Regulations but who would have been eligible under the present Regulations to enter for the examination be admitted subject to special permission in each case

Applications for grants from (1) the Dixon Fund for assisting scientific investigations and (2) the Thomas Smythe Hughes and Beaverbrook Medical Research Funds for assisting original medical research must be sent in between April 1 and May 15 Particulars can be obtained from the Academic Registrar

QUEEN'S UNIVERSITY OF BELFAST

A notice appears in our advertisement columns this week inviting applications for the Musgrave Professorship of Pathology in Queen's University Belfast The salary is £1 000 with non-contributory pension

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH

At a quarterly meeting of the College held on February 2 with the President Dr W T Ritchie in the chair the following were elected Fellows

Dr Ernest T Roberts (Glasgow) Dr Eustace Russell (Brisbane) Dr Douglas J Campbell (Southampton)

Medical News

The Hunterian Society has arranged a banquet to commemorate the two hundred and ninth anniversary of the birth of John Hunter at the May Fair Hotel, Berkeley Street W on Wednesday February 17, at 7 30 p m The guests will include the Lord Mayor and Lady Mayoress of London The Hunterian Oration on The Hunterian Tradition will be delivered before the society by Lord Horder at the Mansion House on Monday, February 22, at 9 p m

A discussion on 'The House as a Home Design, Construction and Equipment as They Affect Comfort will take place at a meeting of the Royal Sanitary Institute at 90, Buckingham Palace Road S W, on Thursday February 18 at 2 30 p m The discussion will be opened by Dr H A Fawcett

Dr E Graham Howe will give a course of four lectures on Pacifism, in the Conway Hall, Red Lion Square W C at 8 p m, on February 15 and 22, and March 1 and 8

Dr Geza Roheim of Budapest is giving the second and third of his public lectures on the psycho analysis of primitive social relations to day (Friday, February 12) and on February 15, at 8 30 p m, at 96 Gloucester Place, London, W 1 The fee for each lecture, payable at the door, is 2s 6d

A meeting of the Society of Radiotherapists of Great Britain and Ireland will be held at 11 Chandos Street W, on Friday February 19 The subject for discussion is 'The Measurement of Tumour Dosage'

The notifications of influenzal pneumonia for the week ending February 6 in London were 132, as compared with 211 for the previous week, and the number of deaths from influenza was 101 as compared with 154 The total number of deaths ascribed to influenza in the 122 great towns (including London) of England and Wales during the week ended February 6 was 976, as compared with 1,155 in the preceding week

A meeting of the Royal Microscopical Society will be held at B M A House, Tavistock Square W C., on Wednesday February 17 at 5 30 p m when papers will be read by Dr J A Murray, F R S, and Dr A S C Lawrence

A general meeting of the British Association of Radiologists will be held at the Royal Society of Medicine on Friday, February 19, at 5 30 p m, when Dr E Lysholm of Stockholm will give an address on Radiological Possibilities of Demonstrating the Exact Location Size and Pathology of Intracranial Expansive Processes All medical practitioners who are interested are invited to attend

Meetings of the Tuberculosis Association will be held at 26 Portland Place W on Friday February 19 At 5 15 p m papers on Simple Pleural Effusions will be read by Dr W J Fenton and Dr E H Hudson, and at 8 30 Dr Otto May will read a paper on Life Insurance and Tuberculosis'

In response to an invitation from Messrs Cadbury Brothers to metropolitan medical officers of health, a party of 114 travelled from London to visit the factory at Bournville During the day the doctors surgery and dentist's room were inspected and Mr A W Knapp chief chemist to the firm gave an address to the visitors, mentioning that at the Bournville works 22 500 samples were analysed last year, not counting examination of milk samples at Cadbury's milk factories He recalled that cocoa and chocolate makers had been pioneers among food manufacturers in setting up chemist departments By the beginning of this century both Rowntree's at York and Cadbury's at Bournville had established laboratories Fry's started a chemist department some years later and Lyons opened their laboratories soon after the war

An appeal will be broadcast from the London Regional Station on Sunday next, February 14 at 8 45 p m, by Lord Sempill, chairman of the Institute of Ray Therapy, Camden Road, N W, for the extension of the Institute's work

On February 5 Dr F G Dawtrey Drewitt was entertained to dinner at the Savile Club by a group of friends in celebration of the sixtieth anniversary of his election to the club In a congratulatory speech the chairman Mr Alan Barlow mentioned that the youngest of the Savilians present that night to pay honour to their oldest fellow member had entered Winchester College exactly sixty five years after Dr Drewitt The company included Sir Harry Stephen whose membership of the club goes back to 1882

Sir Kingsley Wood Minister of Health received on February 4 a deputation from the Sutton and Cheam Epidemic Inquiry Committee and the Beddington and Wallington Urban District Council The deputation pressed the Minister to hold a public local inquiry into the outbreak of gastro enteritis which occurred last summer in the area of supply of the Sutton district water company Sir Kingsley Wood said that he understood that legal proceedings were pending in this matter In view of this he could not properly discuss the merits of the case or hold a local inquiry

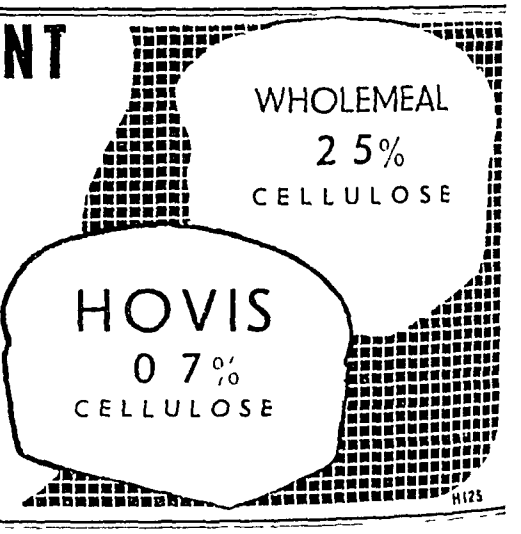
Judge Cotes Preedy K C (who is also a member of the medical profession) has accepted an invitation from all the parties concerned to hold an inquiry in private into criticisms of the action taken by the local authorities of Bournemouth Poole and Christchurch in connexion with the outbreak of typhoid fever in that district last August

The issue of the *Deutsche medizinische Wochenschrift* for January 29 is devoted to pneumonia and influenza

Modern Iron Therapy

Iron 'Jelloids' are an elegant and reliable means of administering the proto-carbonate of iron The preparation has none of the disadvantages of Pil Blaud The iron content remains fresh and unoxidized indefinitely, and injury to the teeth is avoided

The 'Jelloids' are highly effective in the treatment of achlorhydric anæmia and indeed in all the simple anæmias in which massive iron therapy is indicated



Iron Jelloids

You are cordially invited to apply for samples for clinical test
The Iron 'Jelloid' Co Ltd, King George's Avenue, Watford, Herts

LOWER CELLULOSE CONTENT

Reason for Digestibility of HOVIS

Much of the cellulose in wholemeal bread is hard and woody In HOVIS it is soft Thus, although HOVIS contains a lower proportion of cellulose, due to the separation of the bran, it has none of the irritating qualities often attributed to wholemeal It may be taken with perfect freedom by persons of weak digestion

HOVIS TRADE MARK *there is STRENGTH in every SLICE*

By Appointment

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

114 Cardiac Irregularities in Lung Tumours

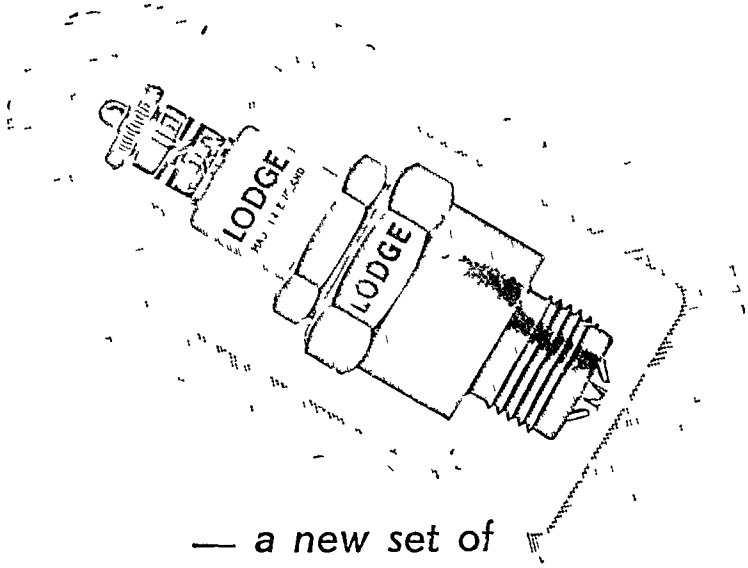
A W C G Kamerling and C L C van Nieuwenhuizen (*Nederl Tijdschr Geneesk* December 26 1936 p 5726), who record eight illustrative cases in patients aged from 41 to 66 state that irregularities of the pulse are not infrequent in pulmonary tumours In six of their cases auricular fibrillation was found (in all but one in attacks) in one paroxysmal sinus tachycardia and in another paroxysmal ventricular tachycardia As these irregularities may sometimes be the first symptom of bronchial carcinoma, as was found in one of the writers cases they possess some diagnostic and prognostic importance Their occurrence may be explained by vagal and sympathetic irritation in accordance with the experiments made on animals by Rothberger and Winterberg and observations on man by Lohr relating to the origin of paroxysmal tachycardia In some of the writers cases distinct signs of sympathetic stimulation were observed such as exophthalmos and dilatation of the pupils while in others the vagus was found to be damaged at necropsy

115 Tuberculous Bacilluria

C Bacaud (*Z Tuberk* December, 1936, p 340) has investigated 226 times the urine of ninety six tuberculous patients He found tubercle bacilli in the urine in only three cases In all these three cases the normal renal function was disturbed two cases suffered from renal tuberculosis and the third from nephritis following the administration of gold The author was also unable to find tubercle bacilli in the urine of seven rabbits and fourteen guinea pigs experimentally infected His conclusions therefore coincide with those of a number of other workers (Spitzer, William and Denver and others) who maintain that the healthy renal filter is impervious to the tubercle bacillus

116 Incidence and Prevention of Diabetic Coma

K Söndergaard (*Ugeskr Laeg* December 3, 1936, p 1207) finds from a study of the statistics of a large Danish hospital that not only is diabetes increasing in frequency in Denmark, but also that a much higher proportion than heretofore of cases of diabetic coma are now being admitted to hospital The rise in the incidence of diabetes in hospital began before the introduction of insulin in 1923 In 1913 there were only seven diabetics among 766 discharged and dead patients (0 9 per cent) By 1921 this percentage had risen to 2 7, and it rose still further to 3 4 in 1935 In the ten year period 1913–22 only 7 per cent of the diabetics admitted to hospital suffered from coma or pre-coma, defined by the author as acidosis with definite signs of poisoning such as vomiting Kussmaul's respiration, and drowsiness In the seven year period 1929–35 this percentage had risen to about 17 A study of the forty two cases of diabetic coma admitted to hospital in the years 1932–5 and the first half of 1936 brought out the inexplicable fact that the sixteen patients who had become comatose without ever having been treated with insulin fared on the whole worse than the twenty six who had been under the influence of insulin before they became comatose It was ascertained that eight of the sixteen comatose patients who had never been treated with insulin had been in the hands of doctors who had let pass on the average five days each before giving insulin The author interprets this serious omission as the result of ignorance on the part of medical practitioners less attentive to the indications of acidosis than to those of glycosuria It is the author's impression that in Denmark sufficient use is not yet made of insulin and he notes that in the years 1925–6 only 48 per cent of the diabetics discharged from his hospital were receiving insulin whereas in the years 1933–5 this percentage had risen to 60 He concludes with an appeal for closer co-operation between medical practitioners hospital physicians, and diabetics



117 Bronzing in Diabetes

M Labbe R Boulin and Ullmann (*Presse méd* November 11, 1936 p 1769) record a case of severe diabetes associated with generalized bronzing of the skin with pronounced melanodermia of the face the genital organs, and the dorsal surfaces of the hands The liver was enlarged there was marked asthenia with a low blood pressure a haemoglobin percentage of 110 and no signs of infection or disorders of the heart and lungs The diagnosis was diabetes complicated by suprarenal insufficiency, and the confirmatory evidence is discussed Tuberculous involvement of the suprarenal glands is known to occur sometimes in diabetes but disease of the sclerotic type is more frequent and this appears to have been the condition in the present case the patient recovering to a considerable extent under suitable treatment After referring to various cases of the different types of such suprarenal involvement which have been recorded in the literature and emphasizing the importance of the presence of hypotension and extreme asthenia as well as the bronzing in reaching a diagnosis the authors comment on the ways in which suprarenal insufficiency may modify the clinical picture in diabetic patients They have previously reported the association of diabetes with infantilism and point out that the question of treatment is of considerable importance In one case of associated Addison's disease and diabetes under their observation an injection of insulin brought on a fatal hypoglycaemic coma at the necropsy pigment was found present in the suprarenal medulla as well as in the cortex They think that some of the unfortunate accidents which have been reported in apparently simple diabetic cases may have been due to there having been an unrecognized sclerosis of the suprarenal glands In one case for example the injection of insulin brought on an epileptic fit which terminated in death from coma The post mortem examination disclosed a partially atrophied condition of the suprarenals Alternatively some of these patients have shown an unexpected resistance to the action of insulin, large doses having to be given The authors conclude that when hyperglycaemia is associated with any signs of suprarenal insufficiency the greatest care must be taken to detect the extent of the complication and to modify the treatment accordingly

118 Circulatory Complications in Diphtheria

H Zischinsky (*Munch med Wschr* November 6 1936 p 1823) has treated 2 800 cases of diphtheria in the past two and a half years There were 150 deaths He points out that circulatory disturbances are the most important complication of diphtheria Myocarditis is always present at necropsy and in these fatal cases marked changes in the electrocardiogram were usually found In such patients symptomatic treatment may help to relieve anxiety pain restlessness and nausea In moderately severe cases there were usually no changes in the electrocardiogram but some of these were fatal Circulatory disturbances and myocarditis must be treated The author found no benefit following the administration of caffeine camphor, strychnine digitalis or adrenaline and while

Neurology

124 Hereditary Psychic Reactions to Insulin

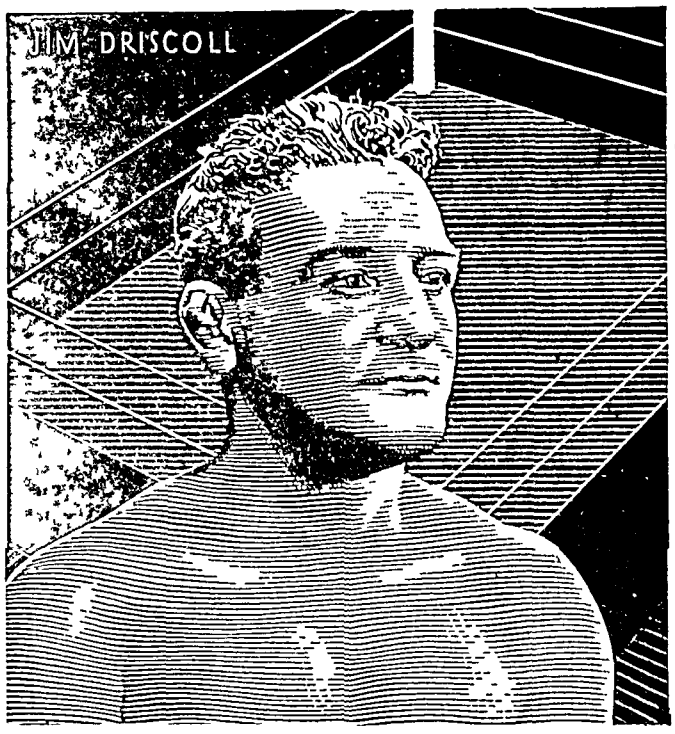
F K STORRING (*Dtsch med Wschr* January 1, 1937, p 10) considers that insulin hypoglycaemia often gives rise to manifestations indicating involvement of the neuro vegetative system Only in a few cases does such hypo glycaemia provoke focal cerebral signs, either isolated or in combination with neuro vegetative manifestations Even rarer are the psychic sequelae to insulin hypo glycaemia and in Professor Umber's hospital in Westend Berlin the author has observed only twelve such cases among the last 1,200 diabetics treated with insulin Suspecting that there might be a hereditary factor the author investigated the family histories of these patients and in most of them he discovered a remarkably close relationship between the character of his patients mental symptoms and that of the mental ailments in their ancestry In one of the cases recorded in detail the hypoglycaemic reaction presented a clinical picture of a typically epilepti form character The patient's brother suffered from genuine epilepsy and his father was a chronic alcoholic

125 Histology of Brain Abscess

PIQUET and BOURY (*Ann Oto laryng* November, 1936, p 1113) present a freely illustrated histological study of material obtained post mortem from three cases of cere bral abscess and of material removed at operation in two other cases Secondary abscesses may communicate with the cavity of the primary abscess (*abces diverticulaires*) or they may be found at a short distance without any visible connexion The histological study of small secondary abscesses is specially profitable, because it enables one to see the beginnings of a brain abscess The earliest stage is a thrombosed capillary surrounded by a cuff of white blood cells (*manchons leucocytaires*), an appearance which strongly suggests a spread by a vascular route It is certain that multiple secondary abscesses are always formed by a diffusion along a vascular route The occlusion of a vessel by thrombosis is the first change, then necrosis of a limited area of brain tissue followed by pus formation One recognizes necrosed cerebral tissue by the following characteristics the vessels are mostly thrombosed, there are scattered lymphoid cells everywhere, the nerve cells are broken up, shrunk, and seem to have lost their processes Very exceptionally a secondary abscess is formed by an invasion of suppuration from the pia mater into the brain sub stance—for instance, in the depth of a fissure The pro gress of an abscess towards the ventricle occurs in differ ent ways In some cases the abscess grows slowly and the ventricle becomes reduced to a slit or sometimes occluded altogether by the formation of a homogeneous mass containing a few fibrils In other more quickly growing abscesses an irruption into the ventricle causes sudden death The processes of repair and replacement of lost cerebral substance were studied in one operation subject where a particularly large abscess had been evacuated five months previously The abscess had de stroyed nearly one half of a cerebral hemisphere and this large cavity became filled with sero purulent fluid Every three weeks or so when signs of intracranial pressure appeared this liquid had to be drained away The firm ness of the 'capsule' depends on the age of the abscess and not on the type of infection as some authors believe

126 Glosso pharyngeal Neuralgia

PIQUET and POTENTIER (*Echo med Nord* December 13 1936 p 1014) describe a case of neuralgia of the glosso pharyngeal nerve in a woman of 50 years who had suffered from pain round the left frontal sinus which dis appeared suddenly and spontaneously Pain had then developed in the left side of the tongue, radiating towards the pharynx and the left ear each spasm lasted only a few moments and recurred five or six times a day The mastoid region was hyperaesthetic, but puncture of the tympanic membrane was negative The distribution of pain suggested glosso pharyngeal neuralgia Injection of novocain into the ninth nerve brought about the temporary cessation of pain during the period of anaesthesia In order to obtain a permanent cure an injection of alcohol was given which caused a large swelling three days later and considerable pain These symptoms subsided and the patient made a complete recovery The case reported was typical of this disease, of which only about twenty cases have been previously described The onset is sudden and is usually brought on by swallowing, mastication, or expectoration The pain is strictly unilateral The treat ment given is simple and safe, and the result is very satisfactory

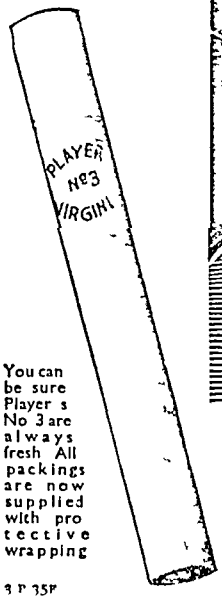


127 Cerebellar Hernia

I VAN BOGAERT (*Scalpel* Liege, December 12 1936 p 2473) points out that the symptoms which are evident before diagnosis of a cerebellar tumour can be made are sometimes very deceptive On the other hand headache, vomiting or papillary oedema may be present The occipital and occipito vertebral syndrome indicates that cerebellar herniation is developing and may lead to paralysis by mechanical compression of the cardio respira tory and bulbo medullary centres Tumours of the fourth ventricle affect the muscles of the head and neck and produce tonic contractions with hypertension of the body adduction of the upper limbs trismus and Cheyne Stokes respiration At a later stage tachycardia facial vaso constriction or vasodilatation dyspnoea, and polyuria develop and usually end in sudden death Lumbar puncture or operation is dangerous, but death is certain if there is no intervention As the result of investigation in eleven cases it has been noted that the following symp toms indicate the presence of a cerebellar hernia dyspnoea cardiac arrhythmia polyuria sitophobia or suboccipital headache When one or more of these symptoms are present lumbar puncture should be carried out to com plete the diagnosis but this may be a fatal procedure Queckenstedt's sign is of value in arriving at a correct diagnosis in these cases Medical treatment in all cases can only be palliative this may include intravenous injections of hypertonic solution of glucose or of mag nesium sulphate and should only be supplementary to surgical treatment This should consist of puncture of the occipital ventricle and the raising of the posterior arch of the atlas or even of the axis

Obstetrics and Gynaecology

128 Pseudo uterine Fibromata

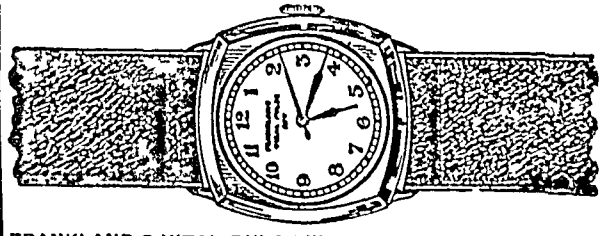


M P BEGOUIN (*Paris med* December 26 1936 p 489) draws attention to the many instances in which lesions of the uterus are wrongly diagnosed The term false fibroma is given to a condition which causes enlargement of the uterus and is therefore thought to be due to fibromata but is really caused by some other type of growth This incorrect diagnosis is most often made when a patient before the menopause has symptoms of men strual irregularity as regards duration and degree of haemorrhage as fibromata are the most common cause of menorrhagia If on palpation of the uterus no tumour can be felt in that organ or the adnexa a general cause such as hypertension hepato splenic insufficiency cardio renal lesion or endocrine disorder should be sought Tumours other than fibromata which may be palpated are adenomyomata submucous polypi, diffuse adeno myomatosis or sarcoma of the uterine wall The last named condition may easily be mistaken for a fibroma,

FAMOUS FIGURES

Peerless' Jim acknowledged one of the greatest exponents of fistic art was born 1880 Professional from 1901 Won British Featherweight Championship Belt outright by three successive victories also European Featherweight Championship in 1912 Greatest fights were with Abe Attell, 1909 Spike Robson Pal Moore and Fred Welsh 1910

Player's No 3 is another figure easily remembered because of its merits, representing, as it does, a Cigarette of delightful *mellowness and flavour*, giving always that little extra quality so necessary for complete enjoyment by the critical smoker



You can be sure Player's No 3 are always fresh All packings are now supplied with protective wrapping

AGAROL *allows measured and uniform dosage*

AGAROL pours freely—as should all good emulsions Fill the spoon for measured and uniform dosage Or if preferred, place *the dose in a glass with water, stir, and take it* that way A pleasing drink it is, too For children, add it to milk—and they like it

Agarol is the original mineral oil and agar-agar emulsion *with phenolphthalein* It affords easier and more thorough mixing with the intestinal contents It offers greater palatability, absence of oily taste, and greater convenience in use There is no sugar in Agarol, no artificial flavouring for the patient to get used to

The treatment of constipation is much less of a problem when you rely on the dependable action of Agarol for thorough softening of the intestinal contents, for evenly distributed lubrication of the intestinal canal, and for gentle stimulation of the peristaltic function

Samples to the medical profession only

A request on your letterhead will bring you a complimentary supply

AGAROL BRAND COMPOUND **FOR CONSTIPATION**

The average dose is one tablespoonful

WILLIAM R WARNER & CO LTD
Power Road Chiswick London W 4

ST. ANDREW'S HOSPITAL
FOR MENTAL DISORDERS
NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER, C.M.G., A.D.C.

Medical Superintendent DANIEL F. RAMBAUT, M.A., M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses, male or female, in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra-Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens, and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL.

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres, Llanfairfechan, amidst the finest scenery in North Wales. On the North-West side of the Estate a mile of sea coast forms the boundary. Patients may visit this branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the sea shore. There is trout fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

NORTHUMBERLAND HOUSE,
GREEN LANES, FINSBURY PARK, N.4

TWO SANDOZ PRODUCTS OF NOTE IN THE FIELD OF NEUROLOGY

FEMERGIN

RELIEVES AND ABORTS MIGRAINE ATTACKS

Clinical experience of recent years has provided ample proof of the fact that no other drug has given results so uniformly successful as has Femergin (ergotamine tartrate) in the treatment of migraine Even patients who have long been subject to migraine attacks, often of great severity, have, in the majority of cases, obtained almost miraculous relief following the administration of Femergin

Femergin is most effective when given early in an attack, but even fully developed seizures are often relieved in one or two hours The dosage should be varied to find the smallest amount that will be effective, but generally 0 25 to 0 5 cc by hypodermic injection will suffice to abort or cut short an attack In mild cases satisfactory relief may be obtained by the oral administration of two tablets

BELLERGAL

CONTROLS AUTONOMIC HYPEREXCITABILITY

Bellergal is the treatment of choice of autonomic nervous disorders It is based on the new conception that such disorders are seldom purely vagotonic or sympathicotonic but are most frequently amphotonic in character, *i e*, accompanied by disturbance in both divisions of the autonomic nervous system

By the combined action of Femergin, inhibitor of the sympathetic Bellafoline, inhibitor of the parasympathetic, and phenobarbitone, sedative of the central nervous system, Bellergal not only controls peripheral autonomic overaction but also exerts a valuable sedative action on the higher centres

The normal daily dose is 4 tablets of which one tablet should be taken in the morning, one at mid-day and two in the evening

Is your

EXTRA PHARMACOPOEIA VOL. 1

the old brown book

or the new blue

21st Edition?

The Extra Pharmacopoeia is accepted throughout the world as an invaluable source of information on medicinal and pharmaceutical substances used in the treatment of disease.

In addition to the official name of a substance, commonly used synonyms and trade names are given. The inclusion of the names of proprietary forms of a drug is invaluable, and affords the only concise information by which so-called new ethical proprietaries are distinguishable from older chemicals or preparations making a new appearance in a modified form. An important improvement on old editions is the inclusion of THE NAME OF THE MANUFACTURER OR AGENT, a system adopted in *The British Pharmaceutical Codex* 1934, and proved by usage to be indispensable. Information on nearly every branded product available in medicine and pharmacy is included, together with an indication of its composition and therapeutic use.

A complete guide to the existing law relating to the sale and supply of poisons and dangerous drugs, with particular reference to the complicated system of control involved by the introduction of the POISONS RULES 1935, has been included. Symbols before the names of poisons and dangerous drugs indicate the conditions which apply.

INFRA-RED RADIATION
IN GENERAL PRACTICE
The "Duo-Ray" Apparatus
AS USED IN THE TEACHING HOSPITALS

The present wide spread interest and use by the medical profession of this method of treatment is undoubtedly due to the remarkable results attending its application primarily in RHEUMATIC AND ALLIED DISORDERS, FIBROSITIS, SCIATICA, LUMBAGO, NEURITIS, SPRAINS, BOILS AND CARBUNCLES, PYLOROSPASM, ETC INSOFAR AS RHEUMATIC AND ALLIED DISORDERS ARE CONCERNED, THE EXTRAORDINARY RELIEF OF PAIN BY HEAT RAYS IS ABUNDANTLY CONFIRMED IN THE COMPREHENSIVE SURVEY INDICATED IN THE REPORT OF THE B M A COMMITTEE ON THE CAUSATION AND TREATMENT OF ARTHRITIS AND ALLIED CONDITIONS (see *B M J*, June 17th, 1933)

There is nothing new in the application of infra red radiation It is but the logical sequence of the epoch making discovery of Prof Finsen in 1883 The apparatus here described is the product of research for a simple yet highly efficient apparatus for the convenient application of this form of radiation, devoid of unnecessary elaboration, perfectly safe in use, and at a very moderate cost It is supplied in two models, one with fixed base and the other with collapsible base for visiting cases A long wave infra red non luminous generator with an interchangeable luminous heat bulb is provided Price complete for either model is 95/6

CATALOGUE No B 106 FULLY DESCRIBING THE DUO RAY APPARATUS WILL BE GLADLY FORWARDED ON REQUEST

Two Specialist Publications of the B.M.A.

★ ARCHIVES OF DISEASE IN CHILDHOOD

This specialist publication covering the whole field of paediatrics is issued bi-monthly and contains original articles of great importance to those who are interested in this particular branch of medical practice.

Archives of Disease in Childhood is printed on high quality paper which lends itself admirably to the reproduction of photographs illustrating the articles including radiographs.

Yearly (Six Numbers), 25/ or 4/6 per copy

○ The Journal of NEUROLOGY AND PSYCHOPATHOLOGY

The specialist in the neurological and allied branches of medical science will find in this quarterly publication articles contributed by the leaders of international thought regarding all kinds of mental conditions. Abstracts from world publications in the same field are also included.

The Journal of Neurology and Psychopathology is printed in such a way as to enable the fullest benefit to be derived from the various illustrations in its pages.

Subscription 30/ per annum or 8/6 per copy

Obtainable from B.M.A. House, Tavistock Square, London, W.C.1

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil" the improved form of salicylate medication

Alasil ' is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro intestinal sequelæ This high tolerability is due to the fact that Alasil ' is composed of calcium acetyl salicylate—the least irritating of the salicylate compounds—and Alocol (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid

A careful series of experimental tests has shown that Alasil is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach

Wide clinical experience anticipated these findings by demonstrating that Alasil can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults the aged and patients with finely balanced digestive capacities An analgesic antipyretic and sedative of established value

A supply for clinical trial with full descriptive literature sent free on request

Ergoapiol-(Smith)

A Menstrual Regulator...

When the periods are irregular, due to constitutional causes, ERGOAPIOL (Smith) is a reliable prescription Containing apiol (M H S special) together with ergot, aloin and oil of savin of the highest quality, this preparation effectively stimulates uterine tone and controls menstrual and postpartum bleeding

In cases of *Amenorrhœa, Dysmenorrhœa, Menorrhagia* and *Metrorrhagia,* Ergoapiol serves as a good uterine tonic and hemostatic Valuable in obstetrics after delivery of the child and for the menstrual irregularity of the *Menopause*

Prescribe 1 to 2 capsules 3 or 4 times daily Supplied only in packages of 20 capsules. Literature on request

As a safeguard against imposition the letters MHS are embossed on the inner surface of each capsule visible only when the capsule is cut in half at seam as shown

Oral Vaccine for the prevention of Colds and Influenza

Since Genora brand Oral Vaccine was introduced to the Medical Profession last Winter, extensive clinical and laboratory tests have shown that it establishes a high degree of immunity against colds and influenza, the oral vaccine has also proved successful in the treatment of chronic bronchitis and similar respiratory infections

This vaccine contains hæmolytic streptococci, in addition to other organisms incriminated in the causation of coryza and influenzal infections It has been found that the ingestion of the oral vaccine against colds and influenza also develops immunity to diseases caused by hæmolytic streptococci

Particulars concerning Genora brand Oral Vaccine will be found in the new brochure on Vaccine Therapy which has recently been published by Genatosan Ltd This booklet also gives information regarding a wide range of vaccines administered by hypodermic injection and the standard types of Local Immunity Products A copy of the brochure will gladly be supplied to any physician on request

GENATOSAN LIMITED

VACCINE DEPARTMENT, LOUGHBOROUGH, LEICS.

TRADE **PLANAVIT A** MARK

(Standardised Solution of Vitamin A)

Vitamin A is of value in supplementing the restricted diets of patients with peptic ulcer, and in providing the additional vitamin needs of infants, of pregnant and nursing mothers, and of patients after operations for removal of calculus It is used prophylactically to maintain the integrity of the epithelial linings throughout the body—particularly the mucous membranes of the respiratory and genito urinary tracts

Supplied in Dropper bottles of 10 c c, each c c containing 25,000 International Units of Vitamin A

G.W.R. Travel Facilities for the Conveyance of Invalids

The Great Western Railway Company offer excellent facilities for the conveyance of hospital patients and other invalids

Patients can make a throughout journey on the Company's new type of stretcher which very materially adds to the comfort of invalids who have to travel lying down

The Company also have well appointed invalid saloons fitted with special couches suspended between the roof and floor to prevent oscillation bedding being provided where necessary The invalid saloons also contain arm chairs, settees and table

Meals are obtainable in most cases invalid chairs are available, and every assistance is rendered by the Company's staff

Full details of these facilities may be obtained from the Superintendent of the Line G W R Paddington Station or from any G W.R Station Master

Why do you allow GRAPES to most invalids?

Professor Loeper has written of the Grape that "it is the best known restorative of bodily function" But, perhaps, what influences you more is the fact that its vitamins and energising elements pass straight into the blood without any effort of digestion This in itself is of prime importance during convalescence Many eminent authorities, indeed, go further and prescribe generous feeding with Vineyard Grapes as part of their treatment of nutritional diseases anaemia and rheumatism amongst them

It is along these lines we seek your interest in VITA, which is Pure Vineyard Grape Juice and nothing else concentrated at a temperature slightly over blood heat so that its Living Ferments are preserved Because it is something he will wish to know about, we invite the practitioner to enquire for further particulars and testing samples

VITA GRAPE JUICE

THE DERBYSHIRE
CHILD'S LIFE SAVED
Resuscitating Apparatus Used By Chesterfield Police
Timely Action at Brimington
The life of a Brimington child was saved on Wednesday by the application of the carbon dioxide resuscitating apparatus with which the Chesterfield Borough Police ambulances are equipped
A workman noticed an 18 months old child Colin Dr... 40 Raleigh Street, Brimington, in a builder's pit containing lime and water [illegible] had been hurt fall in

CO2 SAVES CHILD'S LIFE

We wish to draw the attention of medical practitioners to this newspaper cutting and to the pocket Sparklet Resuscitator Here is an apparatus only 10" long weighing 1¾ lbs in which carbon dioxide is generated from small gas bulbs Each bulb produces 12¾ litres carbon dioxide sufficient for six minutes supply at an optimum rate of 2 litres per minute A fresh bulb can be inserted in a moment. Price of this outfit—32/6d

THE POCKET SPARKLET
RESUSCITATOR

Full particulars of this and other Resuscitator outfits can be obtained from

An Innovation —and an Invitation!

Even in cases where normal hot water baths are contra indicated Zotofoam treatment may safely be prescribed For Zotofoam—by utilizing the remarkable insulating properties of scientifically produced foam—can induce rapid, intense perspiration and in certain cases may be accompanied by a fall in pulse rate and blood pressure

The patient, immersed to the neck in soft light foam and breathing air of normal temperature experiences no feeling of pressure or oppression, but enjoys a definite sense of stimulation enhanced by the gentle massaging action of countless micro bubbles which constantly burst and re form against the skin

"ALOCOL"

Colloidal Hydroxide of Aluminium

Rational Antacid Therapy

APART from those cases due to actual organic disease, the treatment of the syndrome of symptoms known as indigestion, generally resolves itself into an attempt to overcome hypersecretion of acid and to soothe the irritated or inflamed gastric mucosa

That Alocol possesses intrinsic qualities which render it particularly valuable as a gastric sedative and antacid is now well established Its freedom from the constipating effect of bismuth the laxative action of magnesium salts and the gas forming properties of sodium bicarbonate are especially noteworthy

Alocol forms with the gastric contents a colloidal jelly which has the power of adsorbing free hydrochloric acid Its markedly soothing effect on the gastric mucosa promptly relieves pain and discomfort It does not interfere with the normal process of digestion and is free from the danger of alkalosis"

Indian, Sarasvati playing the Vina (12th Century)

Complete chemical history of "Alocol," with convincing clinical reports and supply for trial sent free to physicians on request

The ideal blood builder in pregnancy ☆

The growing foetus of en induces hypochromic anæmia in the pregnant woman, which must be combated with iron in such form as her sensitive stomach and nerves will readily tolerate Ovoferrin, the blood-builder, meets this requirement admirably because it is odourless and practically tasteless It does not affect the teeth and does not constipate It often induces intestinal peristalsis Years of highly satisfactory clinical results have served to classify Ovoferrin as the "ideal haematinic"

Each adult dose of Ovoferrin contains one grain of metallic iron held in colloidal form by a protective protein colloid Ovoferrin is equally effective in children in proportionate dosage

Malnutrition as a cause of Maternal Mortality

Spectacular results have followed the free distribution of selected foodstuffs to necessitous expectant mothers in certain of the depressed areas

The short list of special foods chosen by Medical Officers of Health and other medical experts included

MARMITE

A sharp fall in the puerperal death rate followed immediately upon the introduction of this scheme not a single death occurred amongst those mothers who had received the extra food —(*Public Health* October 1936 p 11)

Marmite is a yeast extract of proved medicinal and dietetic value It is rich in vitamin B_1 and in the B_2 complex and possesses a useful anti-anæmic factor as yet unidentified but possibly associated with vitamin B_6
